Technical Support

Symantec Technical Support maintains support centers globally. Technical Support’s primary role is to respond to specific queries about product features and functionality. The Technical Support group also creates content for our online Knowledge Base. The Technical Support group works collaboratively with the other functional areas within Symantec to answer your questions in a timely fashion. For example, the Technical Support group works with Product Engineering and Symantec Security Response to provide alerting services and virus definition updates.

Symantec’s support offerings include the following:

■ A range of support options that give you the flexibility to select the right amount of service for any size organization
■ Telephone and/or Web-based support that provides rapid response and up-to-the-minute information
■ Upgrade assurance that delivers software upgrades
■ Global support purchased on a regional business hours or 24 hours a day, 7 days a week basis
■ Premium service offerings that include Account Management Services

For information about Symantec’s support offerings, you can visit our Web site at the following URL:

www.symantec.com/business/support/index.jsp

All support services will be delivered in accordance with your support agreement and the then-current enterprise technical support policy.

Contacting Technical Support

Customers with a current support agreement may access Technical Support information at the following URL:

www.symantec.com/business/support/contact_techsupp_static.jsp

Before contacting Technical Support, make sure you have satisfied the system requirements that are listed in your product documentation. Also, you should be at the computer on which the problem occurred, in case it is necessary to replicate the problem.

When you contact Technical Support, please have the following information available:

■ Product release level
Hardware information
Available memory, disk space, and NIC information
Operating system
Version and patch level
Network topology
Router, gateway, and IP address information
Problem description:
  - Error messages and log files
  - Troubleshooting that was performed before contacting Symantec
  - Recent software configuration changes and network changes

Licensing and registration
If your Symantec product requires registration or a license key, access our technical support Web page at the following URL:
www.symantec.com/business/support/

Customer service
Customer service information is available at the following URL:
www.symantec.com/business/support/
Customer Service is available to assist with non-technical questions, such as the following types of issues:
  - Questions regarding product licensing or serialization
  - Product registration updates, such as address or name changes
  - General product information (features, language availability, local dealers)
  - Latest information about product updates and upgrades
  - Information about upgrade assurance and support contracts
  - Information about the Symantec Buying Programs
  - Advice about Symantec’s technical support options
  - Nontechnical presales questions
  - Issues that are related to CD-ROMs or manuals
Support agreement resources

If you want to contact Symantec regarding an existing support agreement, please contact the support agreement administration team for your region as follows:

- Asia-Pacific and Japan: customercare_apac@symantec.com
- Europe, Middle-East, and Africa: semea@symantec.com
- North America and Latin America: supportsolutions@symantec.com

Documentation

Product guides are available on the media in PDF format. Make sure that you are using the current version of the documentation. The document version appears on page 2 of each guide. The latest product documentation is available on the Symantec Web site.

https://sort.symantec.com/documents

Your feedback on product documentation is important to us. Send suggestions for improvements and reports on errors or omissions. Include the title and document version (located on the second page), and chapter and section titles of the text on which you are reporting. Send feedback to:

docs@symantec.com

About Symantec Connect

Symantec Connect is the peer-to-peer technical community site for Symantec’s enterprise customers. Participants can connect and share information with other product users, including creating forum posts, articles, videos, downloads, blogs and suggesting ideas, as well as interact with Symantec product teams and Technical Support. Content is rated by the community, and members receive reward points for their contributions.

Section 1  Installation overview and planning  ................. 21

Chapter 1  About Storage Foundation Cluster File System ......... 23

Veritas Storage Foundation Cluster File System suites .............. 23
About I/O fencing ....................................................................... 24
About Veritas graphical user interfaces ....................................... 25
About Veritas Operations Manager ............................................ 25

Chapter 2  Before you install ...................................................... 27

About planning for SFCFS installation ........................................ 27
About installation and configuration methods ............................... 28
Assessing system preparedness .................................................... 29
  Symantec Operations Readiness Tools .................................... 30
  Prechecking your systems using the Veritas installer ................ 31
Downloading the Veritas Storage Foundation Cluster File System
  software ............................................................................ 31
  Setting environment variables ............................................... 32
  Optimizing LLT media speed settings on private NICs ................ 33
  Guidelines for setting the media speed of the LLT interconnects .... 33
  Creating the /opt directory ................................................... 33
  About configuring ssh or remsh using the Veritas installer ............ 34
  Setting up shared storage .................................................... 34
    Setting up shared storage: SCSI ....................................... 35
    Checking and changing SCSI Initiator IDs .......................... 35
    Setting up shared storage: Fibre Channel .......................... 37
Cluster environment requirements ............................................. 39
Prerequisites for Veritas Storage Foundation Cluster File System
  ..................................................................................... 39
Hardware overview and requirements for Veritas Storage Foundation
  Cluster File System .......................................................... 40
  Shared storage .................................................................... 41
  Fibre Channel switch ....................................................... 41
Chapter 6  Installing Storage Foundation Cluster File System  
using the web-based installer ................................. 65  

About the Web-based installer ........................................ 65  
Features not supported with Web-based installer .......... 66  
Before using the Veritas Web-based installer ................. 66  
Starting the Veritas Web-based installer ..................... 67  
Obtaining a security exception on Mozilla Firefox .......... 67  
Performing a pre-installation check with the Veritas Web-based  
installer ........................................................................ 68  
Installing SFCFS with the Web-based installer ............... 68  

Section 3  Configuration of Veritas Storage  
Foundation Cluster File System ............................... 71  

Chapter 7  Preparing to configure SFCFS ....................... 73  

Preparing to configure the clusters in secure mode .......... 73  
Installing the root broker for the security infrastructure ... 77  
Creating authentication broker accounts on root broker  
system ........................................................................ 78  
Creating encrypted files for the security infrastructure .... 79  
Preparing the installation system for the security  
infrastucture ................................................................ 81  
About configuring SFCFS clusters for data integrity .......... 82  
About I/O fencing for Storage Foundation Cluster File System in  
virtual machines that do not support SCSI-3 PR .......... 83  
About I/O fencing components .................................... 83  
About data disks .......................................................... 84  
About coordination points .......................................... 84  
About preferred fencing .............................................. 85  
About I/O fencing configuration files ......................... 86  
About planning to configure I/O fencing ...................... 88  
Typical SFCFS cluster configuration with server-based I/O  
fencing ......................................................................... 92  
Recommended CP server configurations ..................... 93  
Setting up the CP server ............................................. 96  
Planning your CP server setup .................................... 96  
Installing the CP server using the installer ................... 97  
Configuring the CP server cluster in secure mode .......... 98  
Setting up shared storage for the CP server database .... 99  
Configuring the CP server using the configuration utility ... 100  
Configuring the CP server manually ................................ 108
Chapter 8

Configuring Veritas Storage Foundation Cluster File System .................................................. 111

Configuring Veritas Storage Foundation Cluster File System using the script-based installer ................. 111
Overview of tasks to configure Storage Foundation Cluster File System using the script-based installer ... 111
Starting the software configuration .................................................................................. 112
Specifying systems for configuration .............................................................................. 113
Configuring the cluster name and ID .............................................................................. 114
Configuring private heartbeat links ................................................................................. 114
Configuring the virtual IP of the cluster .......................................................................... 117
Configuring the cluster in secure mode ........................................................................... 119
Adding VCS users ........................................................................................................... 123
Configuring SMTP email notification ............................................................................. 123
Configuring SNMP trap notification .............................................................................. 125
Configuring global clusters ............................................................................................. 127
Completing the VCS configuration .................................................................................. 128
Verifying and updating licenses on the system .................................................................. 130

Configuring Veritas Storage Foundation Cluster File System using the Web-based installer ............... 131

Configuring Veritas Storage Foundation Cluster File System manually ........................................ 137
Configuring Veritas Volume Manager .............................................................................. 137
Configuring Veritas File System ..................................................................................... 145
Configuring the SFDB repository database after installation ............................................... 146

Chapter 9

Configuring SFCFS for data integrity .............................................................................. 147

Setting up disk-based I/O fencing using installsfcfs ......................................................... 147
Initializing disks as VxVM disks ....................................................................................... 147
Configuring disk-based I/O fencing using installsfcfs ....................................................... 148
Checking shared disks for I/O fencing ............................................................................... 151
Setting up disk-based I/O fencing manually ..................................................................... 154
Identifying disks to use as coordinator disks .................................................................... 155
Setting up coordinator disk groups .................................................................................. 156
Creating I/O fencing configuration files ........................................................................... 156
Modifying VCS configuration to use I/O fencing ............................................................... 157
Verifying I/O fencing configuration .................................................................................. 159
Setting up server-based I/O fencing using installsfcfs ...................................................... 159
Configuring server-based I/O fencing using the installsfcfs ............................................ 159
Setting up non-SCSI3 server-based I/O fencing using installsfcs ................................................................. 169
Setting up server-based I/O fencing manually ................................................................. 169
Preparing the CP servers manually for use by the SFCFS cluster ................................................................. 169
Configuring server-based fencing on the SFCFS cluster manually ................................................................. 169
Configuring Coordination Point agent to monitor coordination points ................................................................. 177
Verifying server-based I/O fencing configuration ................................................................. 179
Setting up non-SCSI3 fencing in virtual environments manually ................................................................. 180
Sample /etc/vxfenmode file for non-SCSI3 fencing ................................................................. 182
Enabling or disabling the preferred fencing policy ......................................................................................... 184

Section 4 Upgrading Storage Foundation Cluster File System ................................................................. 187

Chapter 10 Preparing to upgrade Veritas Storage Foundation Cluster File System ................................................................. 189
About upgrading ................................................................................................................................. 189
About the different ways that you can upgrade ......................................................................................... 190
Supported upgrade paths ................................................................................................................................. 190
About using the installer to upgrade when the root disk is encapsulated ................................................................. 192
Preparing to upgrade ................................................................................................................................. 192
Creating backups ........................................................................................................................................... 192
Determining which 5.x release of Veritas File System and Veritas Volume Manager that you have installed ................................................................................................................................. 193
Preparing to upgrade the Veritas software ................................................................................................................................. 194
Preupgrade planning for Veritas Volume Replicator ................................................................................................................................. 197
Preparing to upgrade VVR when VCS agents are configured ................................................................................................................................. 199
Upgrading the array support ................................................................................................................................. 202
Upgrading the disk layout versions ................................................................................................................................. 203

Chapter 11 Performing a typical SFCFS upgrade using the installer ............................................................................ 205
Performing a full upgrade from SFCFS versions on HP-UX 11i v2 to SFCFS 5.1 SP1 ........................................................................................................................................ 205
Performing a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 HP-UX 11iv3 ........................................................................................................................................ 208
Performing a full upgrade from SFCFS 5.x on HP-UX 11i v3 to 5.1 SP1 on the latest HP-UX 11i v3 ................................................................. 208

Chapter 12 Performing a phased upgrade ........................................... 213
Performing a phased upgrade from version 5.x on HP-UX 11i v3 to Veritas Storage Foundation Cluster File System 5.1 SP1 ............ 213
Performing phased upgrade of SFCFS from versions 4.x or 5.x on HP-UX 11i v2 to 5.1SP1 ................................................................. 219
Upgrading Storage Foundation Cluster File System and High Availability software from a release prior to 5.1 SP1 ...................... 224
Upgrading Storage Foundation or Storage Foundation High Availability using the script-based installer ............................... 224

Chapter 13 Upgrading the operating system ........................................... 237
Upgrading the HP-UX operating system ......................................... 237

Chapter 14 Upgrading Veritas Volume Replicator ............................... 239
Upgrading Veritas Volume Replicator ............................................... 239
Upgrading VVR without disrupting replication ............................... 239

Chapter 15 Migrating from SFHA to SFCFS or SFCFS HA ............... 241
Migrating from SFHA to SFCFS or SFCFS HA 5.1 SP1 .................. 241

Chapter 16 Post-upgrade tasks ............................................................. 245
Configuring Powerfail Timeout after upgrade ............................... 245

Section 5 Verification of the installation or the upgrade ............... 247

Chapter 17 Verifying the Storage Foundation Cluster File System installation ................................................................. 249
Verifying that the products were installed ...................................... 250
Installation log files ........................................................................ 250
Using the installation log file ......................................................... 250
Using the summary file ................................................................. 250
About enabling LDAP authentication for clusters that run in secure mode ................................................................. 250
Enabling LDAP authentication for clusters that run in secure mode ........................................ 252
Starting and stopping processes for the Veritas products ........................................ 258
Checking Veritas Volume Manager processes ................................................ 258
Checking Veritas File System installation .................................................. 259
Command installation verification .............................................................. 259
Verifying agent configuration for Storage Foundation Cluster File System .................. 259
Synchronizing time on Cluster File Systems .................................................. 260
Configuring VCS for Storage Foundation Cluster File System .......................... 260
main.cf file ...................................................................................... 261
Storage Foundation Cluster File System HA Only ........................................ 262
Veritas Cluster Server application failover services ............................................. 262
Verifying the cluster UUID when creating a cluster manually ............................... 262
About the cluster UUID .......................................................................... 263
About the LLT and GAB configuration files .................................................... 263
Verifying the LLT, GAB, and VCS configuration files ........................................... 265
Verifying LLT, GAB, and cluster operation .................................................... 266
Verifying LLT ...................................................................................... 266
Verifying GAB ...................................................................................... 268
Verifying the cluster .................................................................................... 270
Verifying the cluster nodes .............................................................................. 271

Section 6  Adding and removing nodes ...................................................... 275
Chapter 18  Adding a node to a cluster ....................................................... 277
About adding a node to a cluster .......................................................................... 277
Before adding a node to a cluster ......................................................................... 277
Meeting hardware and software requirements .................................................... 278
Setting up the hardware ..................................................................................... 278
Preparing to add a node to a cluster ................................................................... 280
Adding a node to a cluster .................................................................................. 280
Adding a node to a cluster using the SFCFS installer ........................................... 281
Adding a node using the Web-based installer ..................................................... 284
Adding the node to a cluster manually ............................................................... 285
Configuring server-based fencing on the new node ............................................. 294
Updating the Storage Foundation for Databases (SFDB) repository after adding a node ................................................................. 296
Chapter 19  Removing a node from Storage Foundation Cluster
File System clusters .......................................................... 297

About removing a node from a cluster ................................ 297
Removing a node from a cluster ........................................... 298
Modifying the VCS configuration files on existing nodes ........ 299
  Editing the /etc/llthosts file .......................................... 299
  Editing the /etc/gabtab file .......................................... 300
  Modifying the VCS configuration to remove the node ......... 300
Removing the node configuration from the CP server .......... 301
Removing security credentials from the leaving node ......... 302
Updating the Storage Foundation for Databases (SFDB) repository after removing a node ......................... 303
Sample configuration file for removing a node from the cluster 303

Section 7  Setting up and configuring replicated global cluster .................................................. 307

Chapter 20  Setting up a replicated global cluster ................. 309

Replication in the SFCFS environment .............................. 309
Requirements for SFCFS global clusters ............................ 310
  Supported software and hardware for SFCFS .................... 310
  Supported replication technologies for SFCFS .................. 310
About setting up a global cluster in an SFCFS environment .... 312
Configuring a cluster at the primary site ........................... 313
Configuring a cluster at the secondary site ......................... 315
  Setting up the cluster on the secondary site ..................... 315
  Setting up the database for the secondary site .................. 316
Configuring replication on clusters at both sites ............... 317
Modifying the ClusterService group for global clusters ...... 317
  Modifying the global clustering configuration using the wizard ...................................................... 317
Defining the remote cluster and heartbeat objects ............... 318
Configuring the VCS service groups for global clusters ....... 322

Chapter 21  Configuring a global cluster using VVR .............. 323

About configuring global clustering using VVR .................. 323
Setting up replication using VVR on the primary site .......... 324
  Creating the SRL volume on the primary site ................... 324
  Setting up the Replicated Volume Group (RVG) on the primary site .............................................. 325
Setting up replication using VVR on the secondary site ........................................ 327
Creating the data and SRL volumes on the secondary site ................................. 327
Editing the /etc/vx/vras/.rdg files .................................................................... 328
Setting up IP addresses for RLINKs on each cluster ........................................ 328
Setting up the disk group on secondary site for replication ............................... 329
Starting replication of application database volume ........................................... 331
Starting replication using automatic synchronization ........................................... 331
Starting replication using full synchronization with Checkpoint ....................... 332
Verifying replication status .................................................................................. 333
Configuring VCS to replicate the database volume using VVR ........................... 333
About modifying the VCS configuration for replication ...................................... 334
Modifying the VCS Configuration on the Primary Site ...................................... 335
Modifying the VCS Configuration on the Secondary Site .................................. 339
Using VCS commands on SFCFS global clusters .............................................. 343
Using VVR commands on SFCFS global clusters .............................................. 343
About migration and takeover of the primary site role ....................................... 344
Migrating the role of primary site to the secondary site ...................................... 344
Migrating the role of new primary site back to the original primary site .......... 345
Taking over the primary role by the remote cluster ............................................ 346
VCS agents to manage wide-area failover ......................................................... 350

Section 8

Uninstallation of Storage Foundation Cluster File System .................................. 353

Chapter 22

Uninstalling Storage Foundation Cluster File System ......................................... 355
Shutting down cluster operations ........................................................................ 355
Disabling the agents on a system ........................................................................ 356
Removing the Replicated Data Set .................................................................... 357
Uninstalling SFCFS with the Veritas Web-based installer ................................... 358
Uninstalling SFCFS depots using the script-based installer ............................... 359
Uninstalling Storage Foundation Cluster File System ........................................ 360
Removing license files (Optional) ...................................................................... 361
Removing the CP server configuration using the removal script ...................... 362
Removing the Storage Foundation for Databases (SFDB) repository after removing the product ................................................................. 365
Section 9 Installation reference .................................................. 367

Appendix A Installation scripts ..................................................... 369
About installation scripts ......................................................... 369
Installation script options ....................................................... 370

Appendix B Response files .......................................................... 377
About response files ............................................................... 377
Installing SFCFS using response files ....................................... 378
Configuring SFCFS using response files ................................... 378
Upgrading SFCFS using response files ..................................... 379
Uninstalling SFCFS using response files ................................... 380
Syntax in the response file ...................................................... 380
Response file variables to install, upgrade, or uninstall Storage
Foundation Cluster File System .............................................. 381
Response file variables to configure Storage Foundation Cluster File
System .............................................................................. 383
Sample response file for SFCFS install ..................................... 384
Sample response file for SFCFS configure ................................. 392

Appendix C Configuring I/O fencing using a response file .......... 395
Configuring I/O fencing using response files ............................. 395
Response file variables to configure disk-based I/O fencing ......... 396
Sample response file for configuring disk-based I/O fencing ...... 397
Response file variables to configure server-based I/O fencing ... 398
Sample response file for configuring server-based I/O fencing ... 399
Response file variables to configure non-SCSI3 server-based I/O
fencing .............................................................................. 401
Sample response file for configuring non-SCSI3 server-based I/O
fencing .............................................................................. 403

Appendix D Configuring the secure shell or the remote shell for
communications ....................................................................... 405
About configuring secure shell or remote shell communication modes
before installing products ..................................................... 405
Configuring and enabling ssh .................................................. 406
Enabling remsh ...................................................................... 410

### Appendix G  Troubleshooting information

- Restarting the installer after a failed connection ........................................ 445
- What to do if you see a licensing reminder ........................................... 445
- Storage Foundation Cluster File System installation issues .................. 446
- Incorrect permissions for root on remote system .............................. 446
- Resource temporarily unavailable ...................................................... 447
- Inaccessible system ........................................................................... 448
- Storage Foundation Cluster File System problems .............................. 449
- Unmount failures .............................................................................. 449
- Mount failures .................................................................................. 449
- Command failures ........................................................................... 450
- Performance issues ........................................................................... 451
- High availability issues ...................................................................... 451
- Upgrading Veritas Storage Foundation for Databases (SFDB) tools 
  from 5.0MP2 to 5.1SP1 (2003131) .................................................. 452

### Appendix H  Troubleshooting cluster installation

- Installer cannot create UUID for the cluster ..................................... 453
- The vxfentsthdw utility fails when SCSI TEST UNIT READY command 
  fails .................................................................................................. 454
- Troubleshooting server-based I/O fencing ....................................... 454
  - Troubleshooting issues related to the CP server service  
    group ......................................................................................... 455
  - Checking the connectivity of CP server ....................................... 455
- Troubleshooting server-based fencing on the SFCFS cluster  
  nodes .............................................................................................. 456
- Issues during fencing startup on SFCFS cluster nodes set up for  
  server-based fencing ....................................................................... 456
- Issues during online migration of coordination points .................... 458
- Troubleshooting server-based I/O fencing in mixed mode .......... 459
  - Checking keys on coordination points when vxfen_mechanism 
    value is set to cps ...................................................................... 463

### Appendix I  Sample SFCFS cluster setup diagrams for CP  
server-based I/O fencing ................................................................. 465

- Configuration diagrams for setting up server-based I/O fencing ...... 465
  - Two unique client clusters served by 3 CP servers ...................... 465
  - Client cluster served by highly available CPS and 2 SCSI-3 
    disks ........................................................................................... 466
  - Two node campus cluster served by remote CP server and 2  
    SCSI-3 disks .............................................................................. 468

**About I/O fencing**

I/O fencing protects the data on shared disks when nodes in a cluster detect a change in the cluster membership that indicates a split-brain condition.

The fencing operation determines the following:

- The nodes that must retain access to the shared storage
- The nodes that must be ejected from the cluster

This decision prevents possible data corruption. The installer installs the I/O fencing driver, VRTSvxfen, when you install Storage Foundation Cluster File System. To protect data on shared disks, you must configure I/O fencing after you install and configure Storage Foundation Cluster File System.

I/O fencing technology uses coordination points for arbitration in the event of a network partition.

You can configure I/O fencing to use one or both of the following components as coordination points:

- **Coordinator disk**: I/O fencing that uses coordinator disks is referred to as disk-based I/O fencing. Disk-based I/O fencing ensures data integrity in a single cluster.
I/O fencing that uses at least one CP server system is referred to as server-based I/O fencing. Server-based I/O fencing ensures data integrity in multiple clusters. In virtualized environments that do not support SCSI-3 PR, Storage Foundation Cluster File System supports non-SCSI3 server-based I/O fencing.

Note: Symantec recommends that you use I/O fencing to protect your cluster against split-brain situations.

About Veritas graphical user interfaces

The following are descriptions of Veritas GUIs.

About Veritas Operations Manager

Veritas Operations Manager by Symantec gives you a single, centralized management console for the Veritas Storage Foundation and High Availability products. You can use it to monitor, visualize, and manage storage and cluster resources, and generate reports about them. Veritas Operations Manager lets administrators centrally manage diverse datacenter environments.

Veritas Operations Manager

Symantec recommends use of Veritas Operations Manager to manage Storage Foundation and Cluster Server environments.

The Veritas Enterprise Administrator (VEA) console is no longer packaged with Storage Foundation products. If you wish to continue using VEA, a version is available for download from http://go.symantec.com/vcsm_download. Veritas Storage Foundation Management Server is no longer supported.

If you wish to manage a single cluster using Cluster Manager (Java Console), a version is available for download from http://go.symantec.com/vcsm_download. Veritas Cluster Server Management Console is no longer supported.

Veritas Operations Manager provides a centralized management console for Veritas Storage Foundation and High Availability products. You can use Veritas Operations Manager to monitor, visualize, and manage storage resources and generate reports. Veritas Operations Manager is not available on the Storage

Refer to the Veritas Operations Manager documentation for installation, upgrade, and configuration instructions.
Before you install

This chapter includes the following topics:

■ About planning for SFCFS installation
■ About installation and configuration methods
■ Assessing system preparedness
■ Downloading the Veritas Storage Foundation Cluster File System software
■ Setting environment variables
■ Optimizing LLT media speed settings on private NICs
■ Guidelines for setting the media speed of the LLT interconnects
■ Creating the /opt directory
■ About configuring ssh or remsh using the Veritas installer
■ Setting up shared storage
■ Cluster environment requirements
■ Prerequisites for Veritas Storage Foundation Cluster File System
■ Hardware overview and requirements for Veritas Storage Foundation Cluster File System

About planning for SFCFS installation

Before you continue, make sure that you are using the current version of this guide. The latest documentation is available on the Symantec website.

http://www.symantec.com/business/support/overview.jsp?pid=15107
This installation guide is designed for system administrators who already have a knowledge of basic UNIX system and network administration. Basic knowledge includes commands such as `tar`, `mkdir`, and simple shell scripting. Also required is basic familiarity with the specific platform and operating system where SFCFS will be installed.

Follow the preinstallation instructions if you are installing one of the Veritas Storage Foundation Cluster File System products by Symantec.

The following Veritas Storage Foundation Cluster File System products by Symantec are installed with these instructions:

- Veritas Storage Foundation Cluster File System
- Veritas Storage Foundation Cluster File System High Availability (HA)

Several component products are bundled with each of these SFCFS products. See “Veritas Storage Foundation Cluster File System suites” on page 23.

About installation and configuration methods

You can use one of the following methods to install and configure SFCFS.
### Table 2-1 Installation and configuration methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
</table>
| Interactive installation and configuration using the script-based installer | You can use one of the following script-based installers:  
- **Common product installer script:** installer  
  The common product installer script provides a menu that simplifies the selection of installation and configuration options. Use this method to install other products, such as the Symantec Product Authentication Service (AT), along with SFCFS.  
- **Product-specific installation script:** installsfcfs  
  The product-specific installation script provides command-line interface options. Installing and configuring with the installsfcfs script is identical to specifying SFCFS from the installer script. Use this method to install or configure only SFCFS.  
  
**Note:** If you obtained SFCFS from an electronic download site, you must use the installsfcfs script instead of the installer script. |
| Silent installation using the response file | The response file automates installation and configuration by using system and configuration information stored in a specified file instead of prompting for information. You can use the script-based installers with the response file to install silently on one or more systems.  
See “About response files” on page 377. |
| Web-based installer                      | The Web-based installer provides an interface to manage the installation and configuration from a remote site using a standard Web browser.  
./webinstaller  
See “About the Web-based installer” on page 65. |
## Assessing system preparedness

Symantec provides the following tools for assessing your system, to ensure that the system meets the requirements for installing Veritas Storage Foundation Cluster File System 5.1 SP1.

### Symantec Operations Readiness Tools

Symantec Operations Readiness Tools (SORT) is a Web-based application that is designed to support Symantec enterprise products.

### Prechecking your systems using the installer

Performs a pre-installation check on the specified systems. The Veritas product installer reports whether the specified systems meet the minimum requirements for installing Veritas Storage Foundation Cluster File System 5.1 SP1.

See “Prechecking your systems using the Veritas installer” on page 31.

---

### Table 2-1  Installation and configuration methods (continued)

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manual installation and configuration</td>
<td>Manual installation uses the HP-UX 11i v3 commands to install SFCFS. To retrieve a list of all depots and patches required for all products in the correct installation order, enter:</td>
</tr>
<tr>
<td></td>
<td># installer -allpkgs</td>
</tr>
<tr>
<td></td>
<td>Use the HP-UX 11i v3 commands to install SFCFS. Then use a manual or an interactive method with installsfcs or installer script to configure the SFCFS stack.</td>
</tr>
</tbody>
</table>
Among its broad set of features, SORT provides patches, patch notifications, and documentation for Symantec enterprise products.

To access SORT, go to:

http://sort.symantec.com

Prechecking your systems using the Veritas installer

The script-based and Web-based installer's precheck option checks for the following:

- Recommended swap space for installation
- Recommended memory sizes on target systems for Veritas programs for best performance
- Required operating system versions

To use the precheck option:

1. Start the script-based or Web-based installer.
2. Select the precheck option:
   - From the Web-based installer, select the **Perform a Pre-Installation Check** from the Task pull-down menu.
   - In the script-based installer, from root on the system where you want to perform the check, start the installer.

```
# ./installer
```

   In the Task Menu, press the p key to start the precheck.
3. Review the output and make the changes that the installer recommends.

Downloading the Veritas Storage Foundation Cluster File System software

One method of obtaining the Veritas Storage Foundation Cluster File System software is to download it to your local system from the Symantec Web site.

For a Trialware download, you can use the following link. For other downloads, contact your Veritas representative for more information.

If you download a standalone Veritas product, the single product download files do not contain the product installer. Use the installation script for the specific product to install the product.

See “About installation scripts” on page 369.

**To download the software**

1. Verify that you have enough space on your filesystem to store the downloaded software.

   The estimated space for download, gunzip, and tar extract is 4 GB.

   If you plan to install the software on the same system, make sure that you also have enough space for the installed software.

   See “Disk space requirements” on page 49.

2. To see the space available, you can use the `df` command with the name of the local file system where you intend to download the software.

   ```
   # df -b filesystem
   ```

   **Caution:** When you select a location to download files, do not select a directory that contains Veritas products from a previous release or maintenance pack. Make sure that different versions exist in different directories.

3. Download the software, specifying the file system with sufficient space for the file.

**Setting environment variables**

Most of the commands used in the installation are in the `/sbin` or `/usr/sbin` directory. Add these directories to your `PATH` environment variable as necessary.

After installation, SFCFS commands are in `/opt/VRTS/bin`. SFCFS manual pages are stored in `/opt/VRTS/man`.

Some VCS custom scripts reside in `/opt/VRTSvcs/bin`. If you are installing a high availability product, add `/opt/VRTSvcs/bin` to the `PATH` also.

Add the following directories to your `PATH` and `MANPATH` environment variable:

- If you are using Bourne or Korn shell (`sh` or `ksh`), enter the following:

  ```
  $ PATH=$PATH:/usr/sbin:/opt/VRTS/bin
  $ MANPATH=/usr/share/man:/opt/VRTS/man:$MANPATH
  $ export PATH MANPATH
  ```
If you are using a C shell (csh or tcsh), enter the following:

```bash
% set path = ( $path /usr/sbin /opt/VRTS/bin )
% setenv MANPATH /usr/share/man:/opt/VRTS/man:$MANPATH
```

### Optimizing LLT media speed settings on private NICs

For optimal LLT communication among the cluster nodes, the interface cards on each node must use the same media speed settings. Also, the settings for the switches or the hubs that are used for the LLT interconnections must match that of the interface cards. Incorrect settings can cause poor network performance or even network failure.

If you use different media speed for the private NICs, Symantec recommends that you configure the NICs with lesser speed as low-priority links to enhance LLT performance.

### Guidelines for setting the media speed of the LLT interconnects

Review the following guidelines for setting the media speed of the LLT interconnects:

- Symantec recommends that you manually set the same media speed setting on each Ethernet card on each node.
  - If you use different media speed for the private NICs, Symantec recommends that you configure the NICs with lesser speed as low-priority links to enhance LLT performance.

- If you have hubs or switches for LLT interconnects, then set the hub or switch port to the same setting as used on the cards on each node.

- If you use directly connected Ethernet links (using crossover cables), Symantec recommends that you set the media speed to the highest value common to both cards, typically 1000_Full_Duplex.

Details for setting the media speeds for specific devices are outside of the scope of this manual. Consult the device's documentation for more information.

### Creating the /opt directory

The directory `/opt` must exist, be writable and must not be a symbolic link.
If you are upgrading, you cannot have a symbolic link from `/opt` to an unconverted volume. If you do have a symbolic link to an unconverted volume, the symbolic link will not function during the upgrade and items in `/opt` will not be installed.

**About configuring ssh or remsh using the Veritas installer**

The installer can configure passwordless secure shell (ssh) or remote shell (remsh) communications among systems. The installer uses the ssh or remsh daemon that comes bundled with the operating system. During an installation, you choose the communication method that you want to use. You then provide the installer with the superuser passwords for the systems where you plan to install. Note that for security reasons, the installation program neither stores nor caches these passwords. The ssh or remsh communication among the systems is removed when the installation process completes, unless the installation abruptly terminates. If installation terminated abruptly, use the installation script's `-comcleanup` option to remove the ssh or remsh configuration from the systems.

See “Installation script options” on page 370.

In most installation, configuration, upgrade (where necessary), and uninstallation scenarios, the installer can configure ssh or remsh on the target systems. In the following scenarios, you need to set up ssh or remsh manually:

- When the root broker is outside of the cluster that you plan to configure.
- When you add new nodes to an existing cluster.
- When the nodes are in a sub-cluster during a phased upgrade.
- When you perform installer sessions using a response file.

See “About configuring secure shell or remote shell communication modes before installing products” on page 405.

**Setting up shared storage**

The following sections describe how to set up the SCSI and the Fibre Channel devices that the cluster systems share.

For I/O fencing, the data disks must support SCSI-3 persistent reservations. You need to configure a coordinator disk group that supports SCSI-3 PR and verify that it works.

See “About planning to configure I/O fencing” on page 88.
See also the *Veritas Storage Foundation Cluster File System Administrator's Guide* for a description of I/O fencing.

## Setting up shared storage: SCSI

Perform the following steps to set up shared storage.

*Figure 2-1* shows how to cable systems for shared storage.

### Figure 2-1  Cabling the shared storage

![Illustration of cabling the shared storage](image)

### To set up shared storage

1. Shut down the systems in the cluster.
2. Install the required SCSI host bus adapters and set up the external shared SCSI storage devices.
3. Cable the external shared storage devices. With cables connected to shared storage between two systems, you must terminate the two ends of the SCSI bus on the systems, as shown in the figure.

   For more than two systems, disable SCSI termination on the systems that are not positioned at the ends of the SCSI chain.

### Checking and changing SCSI Initiator IDs

The SCSI Initiator IDs for the host bus adapters (HBAs) on each of the systems that access the shared storage must be unique. So, you may have to change the HBA SCSI ID on one or more systems if these IDs are the same. Typically, the host bus adapters (HBAs) for the SCSI devices are shipped with a default SCSI ID of 7. Use the following procedure to check SCSI IDs and change them if necessary.
To check and change SCSI initiator IDs

1. For systems with PA architecture, turn on the power of the first system. During the boot process, the system delays for ten seconds, giving you the opportunity to stop the boot process and enter the boot menu:

   To discontinue, press any key within 10 seconds.

   Press any key. The boot process discontinues.

   Boot terminated.

2. When you see the boot Main Menu, display the Information Menu by entering:

   Main Menu: enter command or menu > in

3. From the Information Menu, enter "io" at the prompt for I/O interface information:

   Information Menu: Enter command > io

   The output shows information about the I/O interfaces and resembles:

<table>
<thead>
<tr>
<th>Path Description</th>
<th>Bus (dec)</th>
<th>Slot #</th>
<th>Vendor #</th>
<th>Device Id</th>
<th>Id</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
<td>.</td>
</tr>
<tr>
<td>SCSI bus cntlr</td>
<td>0/3/0/0</td>
<td>24</td>
<td>10</td>
<td>0x1000</td>
<td>0xf</td>
</tr>
</tbody>
</table>

4. Return to the Main Menu:

   Information Menu: Enter command > main

5. Go the Service Menu:

   Main Menu: enter command or menu > ser

6. Display the host bus adapter’s SCSI ID:

   Service Menu: enter command or menu > scsi

   The output displays information about the SCSI devices:
The output in this example shows the SCSI ID is 7, the preset default for the HBA as shipped.

- If you choose, you can leave the ID set at 7 and return to the Main Menu:

  Service Menu: enter command or menu > main

- You can change the SCSI ID for the HBA. For example, to change the SCSI ID from 7 to 6, you would enter:

  Service Menu: Enter command > SCSI init 0/3/0/0 6

  FAST

- To verify the change, enter "SCSI" at the prompt:

  Service Menu: Enter command > SCSI

  Path (dec)  Initiator ID  SCSI Rate  Auto  Term
  -----------------  ---------  ---------  ---------
  0/3/0/0 6  Fast  Unknown

7  Return to the Main Menu:

  Service Menu: enter command or menu > main

8  At the Main Menu, enter the command to boot the system. Answer "n" when you are prompted to interact with IPL:

  Menu: Enter command or menu > boot
  Interact with IPL (Y, N, or Cancel)?> n

  Booting...

Setting up shared storage: Fibre Channel

Perform the following steps to set up Fibre Channel.
To set up Fibre Channel shared storage

1. Shut down the cluster systems that must share the devices.
2. Install the required Fibre Channel host bus adapters on each system.
3. Cable the shared devices.
4. Reboot each system.
5. Verify that each system can see all shared devices. Use the command:

   # ioscan -fnC disk

Where "disk" is the class of devices to be shared. For example, from a system galaxy type:

galaxy# ioscan -fnC disk
Class I H/W Path Driver S/W State H/W Type Description ________________________________________________________________
.
.
disk 4 0/4/0/0.1.16.255.13.4.0 sdisk CLAIMED DEVICE
   SEAGATE ST318304 CLAR18
      /dev/dsk/c4t4d0 /dev/rdsk/c4t4d0
disk 5 0/4/0/0.1.16.255.13.5.0 sdisk CLAIMED DEVICE
   SEAGATE ST318304 CLAR18
      /dev/dsk/c4t5d0 /dev/rdsk/c4t5d0
.
.
And on another system, nebula, enter:

nebula# ioscan -fnC disk
Class I H/W Path Driver S/W State H/W Type Description ________________________________________________________________
.
.
disk 4 0/4/0/0.1.16.255.13.4.0 sdisk CLAIMED DEVICE
   SEAGATE ST318304 CLAR18
      /dev/dsk/c4t4d0 /dev/rdsk/c4t4d0
disk 5 0/4/0/0.1.16.255.13.5.0 sdisk CLAIMED DEVICE
   SEAGATE ST318304 CLAR18
      /dev/dsk/c4t5d0 /dev/rdsk/c4t5d0
.
.
Cluster environment requirements

If your configuration has a cluster, which is a set of hosts that share a set of disks, there are additional requirements.

To set up a cluster environment

1. If you plan to place the root disk group under VxVM control, decide into which disk group you want to configure it for each node in the cluster. The root disk group, usually aliased as `bootdg`, contains the volumes that are used to boot the system. VxVM sets `bootdg` to the appropriate disk group if it takes control of the root disk. Otherwise `bootdg` is set to `nodg`. To check the name of the disk group, enter the command:

   `vxdg bootdg`

2. Decide on the layout of shared disk groups. There may be one or more shared disk groups. Determine how many you wish to use.

3. If you plan to use Dirty Region Logging (DRL) with VxVM in a cluster, leave a small amount of space on the disk for these logs. The log size is proportional to the volume size and the number of nodes. Refer to the Veritas Volume Manager Administrator’s Guide for more information on DRL.

4. Install the license that supports the clustering feature on every node in the cluster.

Prerequisites for Veritas Storage Foundation Cluster File System

Each cluster node must be connected to the public network and each must have a unique host name by which it can be addressed on the public network. The local node from which you install does not have to be part of the cluster.

Provide the following information when installing the SFCFS:

- The cluster name, beginning with a letter (a-z, A-Z).
- A unique ID from 0-65535 for the cluster. Within the public subnet, a new cluster using a duplicate cluster ID can cause existing clusters to fail.
- The host names of the cluster nodes.
- The device names of the network interface cards (NICs) used for the private networks among nodes.
- Establishing communication between nodes is required to install Veritas software from a remote system, or to install and configure a cluster. The node
from which the installation utility is run must have permissions to run `rsh` (remote shell) or `ssh` (secure shell) utilities as root on all cluster nodes or remote systems.

- Symantec recommends configuring the cluster with I/O fencing enabled. I/O fencing requires shared devices to support SCSI-3 Persistent Reservations (PR). Enabling I/O fencing prevents data corruption caused by a split brain scenario.
  The Veritas Storage Foundation Cluster File System is supported without I/O fencing enabled. However, without I/O fencing enabled, split brain scenarios can result in data corruption.

**Hardware overview and requirements for Veritas Storage Foundation Cluster File System**

VxFS cluster functionality runs optimally on a Fibre Channel fabric. Fibre Channel technology provides the fastest, most reliable, and highest bandwidth connectivity currently available. By employing Fibre Channel technology, SFCFS can be used in conjunction with the latest Veritas Storage Area Network (SAN) applications to provide a complete data storage and retrieval solution.

*Figure 2-2* shows the configuration of a cluster file system on a Fibre Channel fabric with a disk array.
Shared storage

Shared storage can be one or more shared disks or a disk array connected either directly to the nodes of the cluster or through a Fibre Channel Switch. Nodes can also have non-shared or local devices on a local I/O channel. It is advisable to have `/`, `/usr`, `/var` and other system partitions on local devices.

Fibre Channel switch

Each node in the cluster must have a Fibre Channel I/O channel to access shared storage devices. The primary component of the Fibre Channel fabric is the Fibre Channel switch.
Cluster platforms

There are several hardware platforms that can function as nodes in a Storage Foundation Cluster File System (SFCFS) cluster.

Install the HP-UX 11i 64-bit operating system with the Sept 2010 HP-UX 11i Version 3.0 or later version of 11iv3 on each node and install a Fibre Channel host bus adapter to allow connection to the Fibre Channel switch.

**Note**: For a cluster to work correctly, all nodes must have the same time. If you are not running the Network Time Protocol (NTP) daemon, make sure the time on all the systems comprising your cluster is synchronized.
System requirements

This chapter includes the following topics:

- Release notes
- Hardware compatibility list (HCL)
- I/O fencing requirements
- Veritas File System requirements
- Supported HP-UX operating systems
- Memory requirements
- CPU requirements
- Node requirements
- Mandatory patch required for Oracle Bug 4130116
- Disk space requirements
- Number of nodes supported

Release notes

The *Release Notes* for each Veritas product contains last minute news and important details for each product, including updates to system requirements and supported software. Review the Release Notes for the latest information before you start installing the product.

The product documentation is available on the Web at the following location:

http://www.symantec.com/business/support/overview.jsp?pid=15107
Hardware compatibility list (HCL)

The hardware compatibility list contains information about supported hardware and is updated regularly. Before installing or upgrading Storage Foundation and High Availability Solutions products, review the current compatibility list to confirm the compatibility of your hardware and software.

For the latest information on supported hardware, visit the following URL:

http://www.symantec.com/docs/TECH74012

For information on specific HA setup requirements, see the Veritas Cluster Server Installation Guide.

I/O fencing requirements

Depending on whether you plan to configure disk-based fencing or server-based fencing, make sure that you meet the requirements for coordination points:

■ Coordinator disks
  See “Coordinator disk requirements for I/O fencing” on page 44.

■ CP servers
  See “CP server requirements” on page 45.

If you have installed Storage Foundation Cluster File System in a virtual environment that is not SCSI-3 PR compliant, review the requirements to configure non-SCSI3 server-based fencing.

See “Non-SCSI3 I/O fencing requirements” on page 48.

Coordinator disk requirements for I/O fencing

Make sure that the I/O fencing coordinator disks meet the following requirements:

■ For disk-based I/O fencing, you must have three coordinator disks.

■ The coordinator disks can be DMP devices or iSCSI devices.

■ Each of the coordinator disks must use a physically separate disk or LUN. Symantec recommends using the smallest possible LUNs for coordinator disks.

■ Each of the coordinator disks should exist on a different disk array, if possible.

■ The coordinator disks must support SCSI-3 persistent reservations.

■ Symantec recommends using hardware-based mirroring for coordinator disks.

■ Coordinator disks must not be used to store data or must not be included in disk groups that store user data.
Coordinator disks cannot be the special devices that array vendors use. For example, you cannot use EMC gatekeeper devices as coordinator disks.

**CP server requirements**

Storage Foundation Cluster File System 5.1SP1 clusters (application clusters) support CP servers which are hosted on the following VCS and SFHA versions:

- VCS 5.1 or 5.1SP1 single-node cluster
  CP server requires LLT and GAB to be configured on the single-node VCS cluster that hosts CP server. This requirement also applies to any single-node application cluster that uses server-based fencing.

- SFHA 5.1 or 5.1SP1 cluster

**Warning:** Before you upgrade CP server nodes to use VCS or SFHA 5.1SP1, you must upgrade all the application clusters that use this CP server to version 5.1SP1. Application clusters at version 5.1 cannot communicate with CP server that runs VCS or SFHA 5.1 SP1.

Make sure that you meet the basic hardware requirements for the VCS/SFHA cluster to host the CP server.

See the *Veritas Cluster Server Installation Guide* or the *Veritas Storage Foundation High Availability Installation Guide*.

**Note:** While Symantec recommends at least three coordination points for fencing, a single CP server as coordination point is a supported server-based fencing configuration. Such single CP server fencing configuration requires that the coordination point be a highly available CP server that is hosted on an SFHA cluster.

Make sure you meet the following additional CP server requirements which are covered in this section before you install and configure CP server:

- Hardware requirements
- Operating system requirements
- Networking requirements (and recommendations)
- Security requirements

*Table 3-1* lists additional requirements for hosting the CP server.
Table 3-1  CP server hardware requirements

<table>
<thead>
<tr>
<th>Hardware required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disk space</td>
<td>To host the CP server on a VCS cluster or SFHA cluster, each host requires the following file system space:</td>
</tr>
<tr>
<td></td>
<td>■ 550 MB in the /opt directory (additionally, the language pack requires another 15 MB)</td>
</tr>
<tr>
<td></td>
<td>■ 300 MB in /usr</td>
</tr>
<tr>
<td></td>
<td>■ 20 MB in /var</td>
</tr>
<tr>
<td>Storage</td>
<td>When CP server is hosted on an SFHA cluster, there must be shared storage between the CP servers.</td>
</tr>
<tr>
<td>RAM</td>
<td>Each CP server requires at least 512 MB.</td>
</tr>
<tr>
<td>CP server to client node physical link</td>
<td>A secure TCP/IP connection is required to connect the CP servers to the Storage Foundation Cluster File System clusters (application clusters).</td>
</tr>
</tbody>
</table>

Table 3-2 displays the CP server supported operating systems and versions. An application cluster can use a CP server that runs any of the following supported operating systems.

<table>
<thead>
<tr>
<th>CP server</th>
<th>Operating system and version</th>

</tbody>
</table>

Review other details such as supported operating system levels and architecture for the supported operating systems. See the Veritas Cluster Server Installation Guide or the Veritas Storage Foundation High Availability Installation Guide.

Following are the CP server networking requirements and recommendations:
Symantec recommends that network access from the application clusters to the CP servers should be made highly-available and redundant. The network connections require either a secure LAN or VPN.

The CP server uses the TCP/IP protocol to connect to and communicate with the application clusters by these network paths. The CP server listens for messages from the application clusters using TCP port 14250. This is the default port that can be changed during a CP server configuration.

The CP server supports either Internet Protocol version 4 or version 6 (IPv4 or IPv6 addresses) when communicating with the application clusters. If the CP server is configured to use an IPv6 virtual IP address, then the application clusters should also be on the IPv6 network where the CP server is being hosted.

When placing the CP servers within a specific network configuration, you must take into consideration the number of hops from the different application cluster nodes to the CP servers. As a best practice, Symantec recommends that the number of hops from the different application cluster nodes to the CP servers should be equal. This ensures that if an event occurs that results in an I/O fencing scenario, there is no bias in the race due to the number of hops between the nodes.

For secure communications between the SFCFS cluster and CP server, consider the following requirements and suggestions:

In a secure communication environment, all CP servers that are used by the application cluster must be configured with security enabled. A configuration where the application cluster uses some CP servers running with security enabled and other CP servers running with security disabled is not supported.

The CP server and application clusters should also use the same root broker. If the same root broker is not being used, then trust can be established between the cluster nodes and CP server for the secure communication. Trust can be established by the installer when configuring fencing.

For non-secure communication between CP server and application clusters, there is no need to configure Symantec Product Authentication Service. In non-secure mode, authorization is still provided by CP server for the application cluster users. The authorization that is performed only ensures that authorized users can perform appropriate actions as per their user privileges on the CP server.

For information about establishing secure communications between the application cluster and CP server, see the *Veritas Storage Foundation Cluster File System Administrator's Guide*. 
Non-SCSI3 I/O fencing requirements

Supported virtual environment for non-SCSI3 fencing:
- HP-UX Integrity Virtual Machines (IVM) Server 4.0 and 4.1

Make sure that you also meet the following requirements to configure non-SCSI3 fencing in the virtual environments that do not support SCSI-3 PR:
- Storage Foundation Cluster File System must be configured with Cluster attribute UseFence set to SCSI3
- All coordination points must be CP servers

Veritas File System requirements

Complete the tasks in this section before installing Veritas File System.

Before installing Veritas File System, perform the following tasks:
- Review the Veritas Storage Foundation Release Notes.
- Ensure that the /opt directory exists and has write permissions for root.
- The Veritas File System does not support OmniStorage. Do not install VxFS without first retrieving any files archived using OmniStorage.
- Install all the latest required HP-UX patches.

Supported HP-UX operating systems

This release of Veritas products can only be installed on a system running HP-UX B.11.31.1009, HP-UX 11i Version 3 September 2010 Operating Environments Update Release or later on the PA-RISC or Itanium platforms.

To verify the operating system version use the swlist command as follows:

```
# swlist | grep HPUX11i
HPUX11i-DC-OE  B.11.31.1009  HP-UX Data Center Operating Environment
```

JFS must be installed on your system prior to installing any Veritas software.

To verify that JFS is installed use the swlist command as follows:

```
# swlist -l product JFS
JFS  B.11.31  Base VxFS File System 4.1 for HP-UX
```
Memory requirements

2 GB of memory is required for Veritas Storage Foundation Cluster File System.

CPU requirements

A minimum of 2 CPUs is required for Veritas Storage Foundation Cluster File System.

Node requirements

All nodes in a Cluster File System must have the same operating system version and update level.

Mandatory patch required for Oracle Bug 4130116

If you are running Oracle versions 9.2.0.6 or 9.2.0.7, you must apply the Oracle patch for Oracle Bug 4130116. Contact Oracle to obtain this patch, and for details on how to apply it.

For more information, refer to the following TechNote:

http://seer.entsupport.symantec.com/docs/333656.htm

Disk space requirements

Before installing any of the Veritas Storage Foundation products, confirm that your system has enough free disk space.

Use the "Perform a Preinstallation Check" (P) menu or the -precheck option of the product installer to determine whether there is sufficient space.

# ./installer -precheck

Number of nodes supported

SFCFS is capable of supporting cluster configurations with up to 64 nodes. Symantec has tested and qualified configurations of up to 32 nodes on IA-64 (Itanium) at the time of the release.

For more updates on this support, see the Late-Breaking News TechNote on the Symantec Technical Support website:

http://www.symantec.com/docs/TECH144835
Licensing Veritas products

This chapter includes the following topics:

■ About Veritas product licensing
■ Setting or changing the product level for keyless licensing
■ Installing Veritas product license keys

About Veritas product licensing

You have the option to install Veritas products without a license key. Installation without a license does not eliminate the need to obtain a license. A software license is a legal instrument governing the usage or redistribution of copyright protected software. The administrator and company representatives must ensure that a server or cluster is entitled to the license level for the products installed. Symantec reserves the right to ensure entitlement and compliance through auditing.

If you encounter problems while licensing this product, visit the Symantec licensing support website.

www.symantec.com/techsupp/

The Veritas product installer prompts you to select one of the following licensing methods:

■ Install a license key for the product and features that you want to install.
  When you purchase a Symantec product, you receive a License Key certificate. The certificate specifies the product keys and the number of product licenses purchased.

■ Continue to install without a license key.
  The installer prompts for the product modes and options that you want to install, and then sets the required product level.
Within 60 days of choosing this option, you must install a valid license key corresponding to the license level entitled or continue with keyless licensing by managing the server or cluster with a management server. If you do not comply with the above terms, continuing to use the Veritas product is a violation of your end user license agreement, and results in warning messages. For more information about keyless licensing, see the following URL: http://go.symantec.com/sfhakeyless

If you upgrade to this release from a prior release of the Veritas software, the product installer does not change the license keys that are already installed. The existing license keys may not activate new features in this release.

If you upgrade with the product installer, or if you install or upgrade with a method other than the product installer, you must do one of the following to license the products:

- Run the `vxkeyless` command to set the product level for the products you have purchased. This option also requires that you manage the server or cluster with a management server.
  See “Setting or changing the product level for keyless licensing” on page 52.
  See the `vxkeyless(1m)` manual page.

- Use the `vxlicinst` command to install a valid product license key for the products you have purchased.
  See “Installing Veritas product license keys” on page 54.
  See the `vxlicinst(1m)` manual page.

You can also use the above options to change the product levels to another level that you are authorized to use. For example, you can add the replication option to the installed product. You must ensure that you have the appropriate license for the product level and options in use.

---

**Note:** In order to change from one product group to another, you may need to perform additional steps.

---

## Setting or changing the product level for keyless licensing

The keyless licensing method uses product levels to determine the Veritas products and functionality that are licensed. In order to use keyless licensing, you must set up a Management Server to manage your systems.

For more information and to download the management server, see the following URL:
When you set the product license level for the first time, you enable keyless licensing for that system. If you install with the product installer and select the keyless option, you are prompted to select the product and feature level that you want to license.

After you install, you can change product license levels at any time to reflect the products and functionality that you want to license. When you set a product level, you agree that you have the license for that functionality.

To set or change the product level

1 View the current setting for the product level.
   
   # vxkeyless -v display

2 View the possible settings for the product level.
   
   # vxkeyless displayall

3 Set the desired product level.
   
   # vxkeyless -q set prod_levels

   where prod_levels is a comma-separated list of keywords.

If you want to remove keyless licensing and enter a key, you must clear the keyless licenses. Use the NONE keyword to clear all keys from the system.

Warning: Clearing the keys disables the Veritas products until you install a new key or set a new product level.

To clear the product license level

1 View the current setting for the product license level.
   
   # vxkeyless [-v] display

2 If there are keyless licenses installed, remove all keyless licenses:
   
   # vxkeyless [-q] set NONE

For more details on using the vxkeyless utility, see the vxkeyless(1m) manual page.
Installing Veritas product license keys

The VRTSvlic depot enables product licensing. After the VRTSvlic is installed, the following commands and their manual pages are available on the system:

- `vxlicinst` Installs a license key for a Symantec product
- `vxlicrep` Displays currently installed licenses
- `vxlictest` Identifies whether a Symantec product feature is licensed on the system

Even though other products are included on the enclosed software discs, you can only use the Symantec software products for which you have purchased a license.

**To install a new license**

- Run the following commands. In a cluster environment, run the commands on each node in the cluster:

  ```
  # cd /opt/VRTS/bin
  # ./vxlicinst -k xxxx-xxxx-xxxx-xxxx-xxxx-xxx
  ```
Section 2

Installation of Storage Foundation Cluster File System

- Chapter 5. Installing Storage Foundation Cluster File System using the common product installer
- Chapter 6. Installing Storage Foundation Cluster File System using the web-based installer
Installing Storage Foundation Cluster File System using the common product installer

This chapter includes the following topics:

- Installation preparation overview
- About installing Veritas Storage Foundation Cluster File System on HP-UX
- Summary of Veritas Storage Foundation installation tasks
- Mounting the product disc
- About the Veritas installer
- Installing Storage Foundation Cluster File System using the product installer

Installation preparation overview

Table 5-1 provides an overview of an installation using the product installer.

<table>
<thead>
<tr>
<th>Installation task</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Obtain product licenses.</td>
<td>See “About Veritas product licensing” on page 51.</td>
</tr>
</tbody>
</table>
### About installing Veritas Storage Foundation Cluster File System on HP-UX

For an initial installation on a new system, you can use one of the installation procedures described in this section. If you have an existing installation of Storage Foundation Cluster File System that you are upgrading, you must perform an upgrade to move to the 5.1 SP1 versions of the Veritas products.

### Summary of Veritas Storage Foundation installation tasks

Installation of Veritas Storage Foundation products consists of the following tasks:

- Obtain a license key, if required.
- If the operating system is not at the required OS fusion level, upgrade the operating system to the latest release.

### Table 5-1  Installation overview (continued)

<table>
<thead>
<tr>

</thead>
</table>
| Download the software, or insert the product DVD.                                | See “Downloading the Veritas Storage Foundation Cluster File System software” on page 31.  
|                                                                                  | See “Mounting the product disc” on page 59.                              |
| Set environment variables.                                                       | See “Setting environment variables” on page 32.                          |
| Create the /opt directory, if it does not exist.                                 | See “Creating the /opt directory” on page 33.                            |
| Configure the secure shell (ssh) on all nodes.                                   | See “About configuring secure shell or remote shell communication modes before installing products” on page 405. |
| Verify that hardware, software, and operating system requirements are met.       | See “Supported HP-UX operating systems” on page 48.                      |
|                                                                                  | See “Release notes” on page 43.                                         |
| Check that sufficient disk space is available.                                   | See “Disk space requirements” on page 49.                                |
| Use the installer to install the products.                                       | See “About the Veritas installer” on page 60.                            |
The operating system is bundled with Veritas Volume Manager and Veritas File System. If the Veritas Volume Manager or Veritas File System is in use, follow the steps in the upgrade chapter to upgrade the Storage Foundation and the operating system.

- If patches for the operating system are required, install the patches before upgrading the product.
- Mount the disk.
- Install the 5.1 SP1 Veritas Storage Foundation product.
  Start the installer and select 'I' for install, or run the appropriate installation script.
- Reboot the system.
  
  ```
  # /usr/sbin/shutdown -r now
  ```
- Configure the Veritas software.
  Start the installer and select 'C' for configure, or run the appropriate installation script with the `--configure` option.

### Mounting the product disc

You must have superuser (root) privileges to load the SFCFS software.

To mount the product disc

1. Log in as superuser on a system where you want to install SFCFS.
   The system from which you install SFCFS need not be part of the cluster. The systems must be in the same subnet.
2. Insert the product disc in the appropriate drive on your local system.
3. Determine the block device file for the DVD drive:
   
   ```
   # ioscan -fnC disk
   ```
   Make a note of the device file as it applies to your system.
4. Create a directory in which to mount the software disc and mount the disc using the appropriate drive name. For example:
   
   ```
   # mkdir -p /dvrom
   # mount /dev/rdsk/c0t0d0 /dvrom
   ```
5  Verify that the disc is mounted:

```
# mount
```

---

**About the Veritas installer**

The installer also enables you to configure the product, verify preinstallation requirements, and view the product’s description.

If you obtained a standalone Veritas product from an electronic download site, the single-product download files do not contain the general product installer. Use the product installation script to install the product.

See “About installation scripts” on page 369.

At most points during the installation you can type the following characters for different actions:

- Use `b` (back) to return to a previous section of the installation procedure. The back feature of the installation scripts is context-sensitive, so it returns to the beginning of a grouped section of questions.

- Use `Control-c` to stop and exit the program if an installation procedure hangs. After a short delay, the script exits.

- Use `q` to quit the installer.

- Use `?` to display help information.

- Use the Enter button to accept a default response.

Additional options are available for the installer.

See “Installation script options” on page 370.

---

**Installing Storage Foundation Cluster File System using the product installer**

The product installer is the recommended method to license and install Storage Foundation Cluster File System or Storage Foundation Cluster File System HA.

The following sample procedure is based on the installation of a Veritas Storage Foundation Cluster File System HA cluster with two nodes: "host1" and "host2". If you are installing on standalone systems only, some steps are unnecessary, and these are indicated.

Default responses are enclosed by parentheses. Press Return to accept defaults.
Note: If you have obtained a Veritas product from an electronic download site, the single product download files do not contain the installer installation script, so you must use the product installation script to install the product. For example, if you download Veritas Cluster File System, use the installsfcfs script instead of the installer script.

To install Storage Foundation Cluster File System products

1. To install on multiple systems, set up the systems so that commands between systems execute without prompting for passwords or confirmations. See “About configuring secure shell or remote shell communication modes before installing products” on page 405.

2. Load and mount the software disc.

3. Move to the top-level directory on the disc.
   
   # cd /dvd_mount

4. From this directory, type the following command to install on the local system. Also use this command to install on remote systems provided that the secure shell (ssh) or remote shell (rsh) utilities are configured:
   
   # ./installer

5. Enter I to install and press Return.

6. From the Installation menu, choose the I option for Install and enter the number for Storage Foundation Cluster File System or Storage Foundation Cluster File System HA. Press Return.

   The example installation assumes you have selected SFCFS HA.

7. At the prompt, specify whether you accept the terms of the End User License Agreement (EULA).

   Do you agree with the terms of the End User License Agreement as specified in the storage_foundation_cluster_file_system/EULA/lang/EULA_CFS_Ux_5.1SP1.pdf file present on the media? [y,n,q,?] y

8. Select from one of the following install options:
   
   ■ Minimal depots: installs only the basic functionality for the selected product.
- Recommended depots: installs the full feature set without optional depots.
- All depots: installs all available depots.

Each option displays the disk space that is required for installation. Select which option you want to install and press Return.

9 You are prompted to enter the system names (in the following example, "host1" and "host2") on which the software is to be installed. Enter the system name or names and then press Return.

Enter the system names separated by spaces: [q?] (host1 host2)

10 During the initial system check, the installer verifies that communication between systems has been set up.

If the installer hangs or asks for a login password, stop the installer and set up ssh or rsh. Then run the installer again.

See “About configuring secure shell or remote shell communication modes before installing products” on page 405.

11 After the system checks complete, the installer displays a list of the depots that will be installed. Press Enter to continue with the installation.
12 You are prompted to choose your licensing method.

To ensure compliance with the terms of Symantec's End User License Agreement you have 60 days to either:

* Enter a valid license key matching the functionality in use on the systems
* Enable keyless licensing and manage the systems with a Management Server (see http://go.symantec.com/vom for details and free download)

1) Enter a valid license key
2) Enable keyless licensing

How would you like to license the systems? [1-2,q] (2)

To install using keyless licensing, select 2. You are prompted for the product modes and the options that you want to install and license.

---

**Note:** The keyless license option enables you to install without entering a key. However, you must still have a valid license to install and use Veritas products.

Keyless licensing requires that you manage the systems with a Management Server. Refer to the following URL for details:

http://go.symantec.com/vom

13 You are prompted to enter the Standard or Enterprise product mode.

Storage Foundation and High Availability Solutions 5.1 Install Program

1) SFCFS Standard HA
2) SFCFS Enterprise HA
b) Back to previous menu

Select product mode to install: [1-2,b,q,?] (1)

14 Select yes to enable the Veritas Volume Replicator.

Would you like to enable Veritas Volume Replicator? [y,n,q] (n) y

15 Select yes to enable the Global Cluster Option.

Would you like to enable Global Cluster option? [y,n,q] (n) y
At the prompt, specify whether you want to send your installation information to Symantec.

Would you like to send the information about this installation to Symantec to help improve installation in the future? [y,n,q,?]
(y) n

Reboot all the nodes in the cluster.

View the log file, if needed, to confirm the installation.

Installation log files, summary file, and response file are saved at:

/opt/VRTS/install/logs/installer-****

Configure Storage Foundation Cluster File System.
Installing Storage Foundation Cluster File System using the web-based installer

This chapter includes the following topics:

- About the Web-based installer
- Features not supported with Web-based installer
- Before using the Veritas Web-based installer
- Starting the Veritas Web-based installer
- Obtaining a security exception on Mozilla Firefox
- Performing a pre-installation check with the Veritas Web-based installer
- Installing SFCFS with the Web-based installer

About the Web-based installer

Use the Web-based installer's interface to install Veritas products. The Web-based installer can perform most of the tasks that the script-based installer performs.

You use the `webinstaller` script to start and stop the Veritas XPortal Server `xprtlwid` process. The `webinstaller` script can also be used to check the status of the XPortal Server.
When the `webinstaller` script starts the `xprtlwid` process, the script displays a URL. Use this URL to access the Web-based installer from Internet Explorer or FireFox.

The Web installer creates log files whenever the Web installer is operating. While the installation processes are operating, the log files are located in a session-based directory under the `/var/tmp` directory. After the install process completes, the log files are located in the `/opt/VRTS/install/logs` directory. It is recommended that you keep the files for auditing, debugging, and for future use.

The location of the Veritas XPortal Server configuration file is `/var/opt/webinstaller/xprtlwid.conf`.

See “Before using the Veritas Web-based installer” on page 66.

See “Starting the Veritas Web-based installer” on page 67.

### Features not supported with Web-based installer

In this release, the following features that can be performed using the script installer are not available in the Web-based installer:

- Configuring server-based I/O fencing
- Configuring non-SCSI3 I/O fencing in virtual environments where SCSI3 is not supported

### Before using the Veritas Web-based installer

The Veritas Web-based installer requires the following configuration.

<table>
<thead>
<tr>
<th>System</th>
<th>Function</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Target system</td>
<td>The systems where you plan to install the Veritas products.</td>
<td>Must be a supported platform for Veritas Storage Foundation Cluster File System 5.1 SP1.</td>
</tr>
<tr>
<td>Installation server</td>
<td>The server where you start the installation. The installation media is accessible from the installation server.</td>
<td>Must use the same operating system as the target systems and must be at one of the supported operating system update levels.</td>
</tr>
</tbody>
</table>
Table 6-1  Web-based installer requirements (continued)

<table>
<thead>
<tr>
<th>System</th>
<th>Function</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrative system</td>
<td>The system where you run the Web browser to perform the installation.</td>
<td>Must have a Web browser.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Supported browsers:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ Internet Explorer 6, and later.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ Firefox 3.x, and later.</td>
</tr>
</tbody>
</table>

Starting the Veritas Web-based installer

This section describes starting the Veritas Web-based installer.

To start the Web-based installer

1  Start the Veritas XPortal Server process `xprt1wid`, on the installation server:

   `#/webinstaller start`

   The webinstaller script displays a URL. Note this URL.

   **Note:** If you do not see the URL, run the command again.

2  On the administrative server, start the Web browser.

3  Navigate to the URL that the script displayed.

4  The browser may display the following message:

   **Secure Connection Failed**

   Obtain a security exception for your browser.

5  When prompted, enter `root` and root's password of the installation server.

Obtaining a security exception on Mozilla Firefox

You may need to get a security exception on Mozilla Firefox.

To obtain a security exception

1  Click **Or you can add an exception** link.

2  Click **Add Exception** button.
3 Click **Get Certificate** button.
4 Uncheck **Permanently Store this exception checkbox (recommended)**.
5 Click **Confirm Security Exception** button.
6 Enter root in User Name field and root password of the web server in the Password field.

**Performing a pre-installation check with the Veritas Web-based installer**

This section describes performing a pre-installation check with the Veritas Web-based installer.

**To perform a pre-installation check**

1 Start the Web-based installer.
   See “**Starting the Veritas Web-based installer**” on page 67.
2 On the Select a task and a product page, select **Perform a Pre-installation Check** from the **Task** drop-down list.
3 Select the product from the **Product** drop-down list, and click **Next**.
4 Indicate the systems on which to perform the precheck. Enter one or more system names, separated by spaces. Click **Validate**.
5 The installer performs the precheck and displays the results.
6 If the validation completes successfully, the installer prompts you to begin the installation. Click **Yes** to install on the selected system. Click **No** to install later.
7 Click **Finish**. The installer prompts you for another task.

**Installing SFCFS with the Web-based installer**

This section describes installing SFCFS with the Veritas Web-based installer.

**To install SFCFS using the Web-based installer**

1 Perform preliminary steps. See “**Performing a pre-installation check with the Veritas Web-based installer**” on page 68.
2 Select **Install a Product** from the **Task** drop-down list.
3 Select **Veritas Storage Foundation Cluster File System** from the Product drop-down list, and click **Next**.
4 On the License agreement page, read the End User License Agreement (EULA). To continue, select Yes, I agree and click Next.

5 Choose minimal, recommended, or all depots. Click Next.

6 Indicate the systems where you want to install. Separate multiple system names with spaces. Click Validate.

7 If you have not yet configured a communication mode among systems, you have the option to let the installer configure ssh or remsh. If you choose to allow this configuration, select the communication mode and provide the superuser passwords for the systems.

8 After the validation completes successfully, click Next to install SFCFS or SFCFSHA on the selected system.

9 After the installation completes, you must choose your licensing method. On the license page, select one of the following tabs:

   ■ Keyless licensing

---

**Note:** The keyless license option enables you to install without entering a key. However, in order to ensure compliance you must manage the systems with a management server.

For more information, go to the following website:

http://go.symantec.com/sfhakeyless

---

Complete the following information:

   ■ Choose whether you want to enable Veritas Volume Replicator. Click Register.

   ■ Enter license key

If you have a valid license key, select this tab. Enter the license key for each system. Click Register.
10 The installer prompts you to configure the cluster. Select Yes to continue with configuring the product.

If you select NO, you can exit the installer. You must configure the product before you can use SFCFS.

After the installation completes, the installer displays the location of the log and summary files. If required, view the files to confirm the installation status.

11 Select the checkbox to specify whether you want to send your installation information to Symantec.

Would you like to send the information about this installation to Symantec to help improve installation in the future?

Click Finish.
Configuration of Veritas Storage Foundation Cluster File System

- Chapter 7. Preparing to configure SFCFS
- Chapter 8. Configuring Veritas Storage Foundation Cluster File System
- Chapter 9. Configuring SFCFS for data integrity
Preparing to configure SFCFS

This chapter includes the following topics:

- Preparing to configure the clusters in secure mode
- About configuring SFCFS clusters for data integrity
- About I/O fencing for Storage Foundation Cluster File System in virtual machines that do not support SCSI-3 PR
- About I/O fencing components
- About I/O fencing configuration files
- About planning to configure I/O fencing
- Setting up the CP server

Preparing to configure the clusters in secure mode

You can set up Symantec Product Authentication Service (AT) for the cluster during or after the Storage Foundation Cluster File System configuration.

In a cluster that is online, if you want to enable or disable AT using the installsfcfs -security command, see the Veritas Cluster Server Administrator's Guide for instructions.

The prerequisites to configure a cluster in secure mode are as follows:

- A system in your enterprise that serves as root broker (RB).
  
  You can either use an external system as root broker, or use one of the cluster nodes as root broker.
■ To use an external root broker, identify an existing root broker system in your enterprise or install and configure root broker on a stable system. See “Installing the root broker for the security infrastructure” on page 77.

■ To use one of the cluster nodes as root broker, the installer does not require you to do any preparatory tasks. When you configure the cluster in secure mode using the script-based installer, choose the automatic mode and choose one of the nodes for the installer to configure as root broker.

Symantec recommends that you configure a single root broker system for your entire enterprise. If you use different root broker systems, then you must establish trust between the root brokers. For example, if the management server and the cluster use different root brokers, then you must establish trust.

■ For external root broker, an authentication broker (AB) account for each node in the cluster is set up on the root broker system. See “Creating authentication broker accounts on root broker system” on page 78.

■ The system clocks of the external root broker and authentication brokers must be in sync.

The script-based installer provides the following configuration modes:

- **Automatic mode**
  The external root broker system must allow remsh or ssh passwordless login to use this mode.

- **Semi-automatic mode**
  This mode requires encrypted files (BLOB files) from the AT administrator to configure a cluster in secure mode. The nodes in the cluster must allow remsh or ssh passwordless login.

- **Manual mode**
  This mode requires root_hash file and the root broker information from the AT administrator to configure a cluster in secure mode. The nodes in the cluster must allow remsh or ssh passwordless login.

*Figure 7-1* depicts the flow of configuring Storage Foundation Cluster File System cluster in secure mode.
**Figure 7-1** Workflow to configure Storage Foundation Cluster File System cluster in secure mode

1. Identify a root broker system or install root broker on a system
2. Choose automatic mode at the installer prompt to configure the cluster in secure mode
3. Choose the node that the installer must configure as root broker
4. Automatic mode
   - On the root broker system, create authentication broker identities for each node
   - Does the root broker allow you to login without password
     - No
       - On the root broker system, create encrypted file (BLOB) for each node
       - Copy encrypted files to the installation system
       - Set up passwordless communication between nodes
       - Follow the installer prompts to configure the cluster in secure mode
     - Yes
       - Copy root_hash file from the root broker system to the installation system
       - Gather information to answer prompts
       - Set up passwordless communication between nodes
6. Semi-automatic mode
   - Installer option to configure the cluster in secure mode
   - Set up passwordless communication between nodes
7. Manual mode
   - Does the root broker allow you to login without password
     - No
6. External system
   - Root broker system?
   - One of the cluster nodes

---

If VCS users belong to LDAP domain, enable LDAP authentication plugin
Table 7-1 lists the preparatory tasks in the order which the AT and VCS administrators must perform. These preparatory tasks apply only when you use an external root broker system for the cluster.

Table 7-1 Preparatory tasks to configure a cluster in secure mode (with an external root broker)

</table>

**Installing the root broker for the security infrastructure**

Install the root broker only if you plan to use AT to configure the cluster in secure mode. You can use a system outside the cluster or one of the systems within the cluster as root broker. If you plan to use an external broker, the root broker administrator must install and configure the root broker before you configure the Authentication Service for Storage Foundation Cluster File System. Symantec recommends that you install the root broker on a stable system that is outside the cluster.

You can also identify an existing root broker system in the data center to configure the cluster in secure mode. The root broker system can run AIX, HP-UX, Linux, or Solaris operating system.

See Symantec Product Authentication Service documentation for more information.

**To install the root broker**

1. Mount the product disc and start the installer.
   
   ```
   # ./installer
   ```

2. From the Task Menu, choose I for "Install a Product."

3. From the displayed list of products to install, choose: Symantec Product Authentication Service (AT).

4. Enter 2 to install the recommended packages.

5. Enter the name of the system where you want to install the Root Broker.
   
   Enter the `operating_system` system names separated by space `[q,?]`: `venus`

6. Review the output as the installer does the following:
   
   - Checks to make sure that AT supports the operating system
- Checks if the depots are already on the system.

The installer lists the depots that the program is about to install on the system. Press Enter to continue.

7 Review the output as the installer installs the root broker on the system.
8 After the installation, configure the root broker.
9 Select a mode to configure the root broker from the three choices that the installer presents:

1) Root+AB Mode
2) Root Mode
3) AB Mode

Enter the mode in which you would like AT to be configured? [1-3,q] 2

All AT processes that are currently running must be stopped

Do you want to stop AT processes now? [y,n,q,?] (y)

10 Press Enter to continue and review the output as the installer starts the Authentication Service.

Creating authentication broker accounts on root broker system

On the root broker system, the administrator must create an authentication broker (AB) account for each node in the cluster.

To create authentication broker accounts on root broker system

1 Determine the root broker domain name. Enter the following command on the root broker system:

venus> # vssat showalltrustedcreds

For example, the domain name resembles "Domain Name: root@venus.symantecexample.com" in the output.

2 For each node in the cluster, verify whether an account exists on the root broker system.

For example, to verify that an account exists for node galaxy:

venus> # vssat showprpl --pdrtype root \
   --domain root@venus.symantecexample.com --prplname galaxy
If the output displays the principal account on root broker for the authentication broker on the node, then delete the existing principal accounts. For example:

venus> # vssat deleteprpl --pdrtype root \ 
--domain root@venus.symantecexample.com \ 
--prplname galaxy --silent

If the output displays the following error, then the account for the given authentication broker is not created on this root broker:

"Failed To Get Attributes For Principal"

Proceed to step 3.

3 Create a principal account for each authentication broker in the cluster. For example:

venus> # vssat addprpl --pdrtype root --domain \ 
root@venus.symantecexample.com --prplname galaxy \ 
--password password --prpltype service

You must use this password that you create in the input file for the encrypted file.

Creating encrypted files for the security infrastructure

Create encrypted files (BLOB files) only if you plan to choose the semiautomatic mode that uses an encrypted file to configure the Authentication Service. The administrator must create the encrypted files on the root broker node. The administrator must create encrypted files for each node that is going to be a part of the cluster before you configure the Authentication Service for SFCFS.

To create encrypted files

1 Make a note of the following root broker information. This information is required for the input file for the encrypted file:

<table>
<thead>
<tr>
<th>hash</th>
<th>The value of the root hash string, which consists of 40 characters. Execute the following command to find this value:</th>
</tr>
</thead>
<tbody>
<tr>
<td>venus&gt; # vssat showbrokerhash</td>
<td></td>
</tr>
</tbody>
</table>
The value for the domain name of the root broker system. Execute the following command to find this value:

```
venus> # vssat showalltrustedcreds
```

2 Make a note of the following authentication broker information for each node. This information is required for the input file for the encrypted file:

- **identity**: The value for the authentication broker identity, which you provided to create authentication broker principal on the root broker system.
  
  This is the value for the `--prplname` option of the `addprpl` command.
  
  See “Creating authentication broker accounts on root broker system” on page 78.

- **password**: The value for the authentication broker password, which you provided to create authentication broker principal on the root broker system.
  
  This is the value for the `--password` option of the `addprpl` command.
  
  See “Creating authentication broker accounts on root broker system” on page 78.

3 For each node in the cluster, create the input file for the encrypted file.

The installer presents the format of the input file for the encrypted file when you proceed to configure the Authentication Service using encrypted file. For example, the input file for authentication broker on galaxy resembles:

```
[setuptrust]
broker=venus.symantecexample.com
hash=758a33dbd6fae751630058ace3dedb54e562fe98
securitylevel=high

[configab]
identity=galaxy
password=password
root_domain=root@venus.symantecexample.com
root_broker=venus.symantecexample.com:2821
```
start_broker=false
enable_pbx=false

4 Back up these input files that you created for the authentication broker on each node in the cluster.

Note that for security purposes, the command to create the output file for the encrypted file deletes the input file.

5 For each node in the cluster, create the output file for the encrypted file from the root broker system using the following command:

```
RootBroker> # vssat createpkg \
--in /path/to/blob/input/file.txt \
--out /path/to/encrypted/blob/file.txt \ 
--host_ctx AB-hostname
```

For example:

```
venus> # vssat createpkg --in /tmp/galaxy.blob.in \ 
--out /tmp/galaxy.blob.out --host_ctx galaxy
```

Note that this command creates an encrypted file even if you provide wrong password for "password=" entry. But such an encrypted file with wrong password fails to install on authentication broker node.

6 After you complete creating the output files for the encrypted file, you must copy these encrypted BLOB files for each node in the cluster.

Preparing the installation system for the security infrastructure

The VCS administrator must gather the required information and prepare the installation system to configure a cluster in secure mode.

To prepare the installation system for the security infrastructure

◆ Depending on the configuration mode you decided to use, do one of the following:

<table>
<thead>
<tr>
<th>Automatic mode</th>
<th>Do the following:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>■ Gather the root broker system name from the AT architect.</td>
</tr>
<tr>
<td></td>
<td>■ During SFCFS configuration, choose the configuration option 1 when the installsfcfs prompts.</td>
</tr>
</tbody>
</table>
Semi-automatic mode  Do the following:

- Copy the encrypted files (BLOB files) to the system from where you plan to install VCS.
  Note the path of these files that you copied to the installation system.
- During SFCFS configuration, choose the configuration option 2 when the installsfcfs prompts.

Manual mode  Do the following:

- Copy the root_hash file that you fetched to the system from where you plan to install VCS.
  Note the path of the root hash file that you copied to the installation system.
- Gather the root broker information such as name, fully qualified domain name, domain, and port from the AT administrator.
- Note the principal name and password information for each authentication broker that you provided to the AT administrator to create the authentication broker accounts.
- During SFCFS configuration, choose the configuration option 3 when the installsfcfs prompts.

About configuring SFCFS clusters for data integrity

When a node fails, SFCFS takes corrective action and configures its components to reflect the altered membership. If an actual node failure did not occur and if the symptoms were identical to those of a failed node, then such a corrective action would cause a split-brain situation.

Some scenarios that can cause such split-brain situations are as follows:

- Broken set of private networks
  If a system in a two-node cluster fails, the system stops sending heartbeats over the private interconnects. The remaining node then takes corrective action. The failure of the private interconnects, instead of the actual nodes, presents identical symptoms and causes each node to determine its peer has departed. This situation typically results in data corruption because both nodes try to take control of data storage in an uncoordinated manner.

- System that appears to have a system-hang
  If a system is so busy that it appears to stop responding, the other nodes could declare it as dead. This declaration may also occur for the nodes that use the hardware that supports a "break" and "resume" function. When a node drops
to PROM level with a break and subsequently resumes operations, the other
nodes may declare the system dead. They can declare it dead even if the system
later returns and begins write operations.

I/O fencing is a feature that prevents data corruption in the event of a
communication breakdown in a cluster. SFCFS uses I/O fencing to remove the
risk that is associated with split-brain. I/O fencing allows write access for members
of the active cluster. It blocks access to storage from non-members so that even
a node that is alive is unable to cause damage.

After you install and configure SFCFS, you must configure I/O fencing in SFCFS
to ensure data integrity.

See “About planning to configure I/O fencing” on page 88.

About I/O fencing for Storage Foundation Cluster File
System in virtual machines that do not support SCSI-3 PR

In a traditional I/O fencing implementation, where the coordination points are
coordination point servers (CP servers) or coordinator disks, Veritas Clustered
Volume Manager and Veritas I/O fencing modules provide SCSI-3 persistent
reservation (SCSI-3 PR) based protection on the data disks. This SCSI-3 PR
protection ensures that the I/O operations from the losing node cannot reach a
disk that the surviving sub-cluster has already taken over.

In virtualized environments that do not support SCSI-3 PR, Storage Foundation
Cluster File System attempts to provide reasonable safety for the data disks.
Storage Foundation Cluster File System requires you to configure non-SCSI3
server-based I/O fencing in such environments. Non-SCSI3 fencing uses CP servers
as coordination points with some additional configuration changes to support I/O
fencing in such environments.

See “Setting up non-SCSI3 server-based I/O fencing using installsfcfs” on page 169.
See “Setting up non-SCSI3 fencing in virtual environments manually” on page 180.

About I/O fencing components

The shared storage for SFCFS must support SCSI-3 persistent reservations to
enable I/O fencing. SFCFS involves two types of shared storage:

- Data disks—Store shared data
  See “About data disks” on page 84.
Coordination points—Act as a global lock during membership changes
See “About coordination points” on page 84.

About data disks
Data disks are standard disk devices for data storage and are either physical disks or RAID Logical Units (LUNs).

These disks must support SCSI-3 PR and must be part of standard VxVM or CVM disk groups. CVM is responsible for fencing data disks on a disk group basis. Disks that are added to a disk group and new paths that are discovered for a device are automatically fenced.

About coordination points
Coordination points provide a lock mechanism to determine which nodes get to fence off data drives from other nodes. A node must eject a peer from the coordination points before it can fence the peer from the data drives. Racing for control of the coordination points to fence data disks is the key to understand how fencing prevents split-brain.

**Note:** Typically, a fencing configuration for a cluster must have three coordination points. Symantec also supports server-based fencing with a single CP server as its only coordination point with a caveat that this CP server becomes a single point of failure.

The coordination points can be disks, servers, or both.

- **Coordinator disks**
  Disks that act as coordination points are called coordinator disks. Coordinator disks are three standard disks or LUNs set aside for I/O fencing during cluster reconfiguration. Coordinator disks do not serve any other storage purpose in the SFCFS configuration.

  Dynamic Multi-pathing (DMP) allows coordinator disks to take advantage of the path failover and the dynamic adding and removal capabilities of DMP. On cluster nodes with HP-UX 11i v3, you must use DMP devices or iSCSI devices for I/O fencing. The following changes in HP-UX 11i v3 require you to not use raw devices for I/O fencing:
  - Provides native multipathing support
  - Does not provide access to individual paths through the device file entries
The metanode interface that HP-UX provides does not meet the SCSI-3 PR requirements for the I/O fencing feature. You can configure coordinator disks to use Veritas Volume Manager Dynamic Multi-pathing (DMP) feature. See the *Veritas Volume Manager Administrator’s Guide*.

- **Coordination point servers**

  The coordination point server (CP server) is a software solution which runs on a remote system or cluster. CP server provides arbitration functionality by allowing the SFCFS cluster nodes to perform the following tasks:

  - Self-register to become a member of an active SFCFS cluster (registered with CP server) with access to the data drives
  - Check which other nodes are registered as members of this active SFCFS cluster
  - Self-unregister from this active SFCFS cluster
  - Forcefully unregister other nodes (preempt) as members of this active SFCFS cluster

  In short, the CP server functions as another arbitration mechanism that integrates within the existing I/O fencing module.

  **Note:** With the CP server, the fencing arbitration logic still remains on the SFCFS cluster.

Multiple SFCFS clusters running different operating systems can simultaneously access the CP server. TCP/IP based communication is used between the CP server and the SFCFS clusters.

### About preferred fencing

The I/O fencing driver uses coordination points to prevent split-brain in a VCS cluster. By default, the fencing driver favors the subcluster with maximum number of nodes during the race for coordination points. With the preferred fencing feature, you can specify how the fencing driver must determine the surviving subcluster.

You can configure the preferred fencing policy using the cluster-level attribute PreferredFencingPolicy as follows:

- Enable system-based preferred fencing policy to give preference to high capacity systems.
- Enable group-based preferred fencing policy to give preference to service groups for high priority applications.
■ Disable preferred fencing policy to use the default node count-based race policy.

See “Enabling or disabling the preferred fencing policy” on page 184.

About I/O fencing configuration files

Table 7-2 lists the I/O fencing configuration files.

Table 7-2  I/O fencing configuration files

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
</table>
| /etc/rc.config.d/vxfenconf | This file stores the start and stop environment variables for I/O fencing:  
  ■ VXFEN_START—Defines the startup behavior for the I/O fencing module after a system reboot. Valid values include:  
    1—Indicates that I/O fencing is enabled to start up.  
    0—Indicates that I/O fencing is disabled to start up.  
  ■ VXFEN_STOP—Defines the shutdown behavior for the I/O fencing module during a system shutdown. Valid values include:  
    1—Indicates that I/O fencing is enabled to shut down.  
    0—Indicates that I/O fencing is disabled to shut down.  

  The installer sets the value of these variables to 1 at the end of Storage Foundation Cluster File System configuration. |
| /etc/vxfendg           | This file includes the coordinator disk group information. This file is not applicable for server-based fencing. |

### Table 7-2  
I/O fencing configuration files (continued)

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
</table>
| /etc/vxfentab | When I/O fencing starts, the vxfen startup script creates this /etc/vxfentab file on each node. The startup script uses the contents of the /etc/vxfendg and /etc/vxfenmode files. Any time a system is rebooted, the fencing driver reinitializes the vxfentab file with the current list of all the coordinator points. **Note:** The /etc/vxfentab file is a generated file; do not modify this file. An example of the /etc/vxfentab file in a disk-based fencing configuration on one node resembles as follows:  
/dev/vx/rdmp/c1t1d0  
/dev/vx/rdmp/c2t1d0  
/dev/vx/rdmp/c3t1d0  
For server-based fencing, the /etc/vxfentab file also includes the security settings information.  
For server-based fencing with single CP server, the /etc/vxfentab file also includes the single_cp settings information. |

---

### About planning to configure I/O fencing

After you configure Storage Foundation Cluster File System with the installer, you must configure I/O fencing in the cluster for data integrity.

You can configure either disk-based I/O fencing or server-based I/O fencing. If your enterprise setup has multiple clusters that use VCS for clustering, Symantec recommends you to configure server-based I/O fencing.

The coordination points in server-based fencing can include only CP servers or a mix of CP servers and coordinator disks. Symantec also supports server-based fencing with a single coordination point which is a single highly available CP server that is hosted on an SFHA cluster.

**Warning:** For server-based fencing configurations that use a single coordination point (CP server), the coordination point becomes a single point of failure. In such configurations, the arbitration facility is not available during a failover of the CP server in the SFHA cluster. So, if a network partition occurs on any application cluster during the CP server failover, the application cluster is brought down.
If you have installed Storage Foundation Cluster File System in a virtual environment that is not SCSI-3 PR compliant, you can configure non-SCSI3 server-based fencing.

See Figure 7-3 on page 91.

Figure 7-2 illustrates a high-level flowchart to configure I/O fencing for the Storage Foundation Cluster File System cluster.
Figure 7-2 shows the workflow to configure I/O fencing.

**Preparatory tasks**
- Initialize disks as VxVM disks
- Check disks for I/O fencing compliance

**Configuration tasks**
- Use one of the following methods:
  - Run `installsfcs -fencing`, choose option 2 and follow the prompts
  - Edit the response file you created and use them with `installsfcs -responsefile` command
  - Manually configure disk-based I/O fencing
  - Choose to configure disk-based fencing when you configure SFCFS using the Web-based installer

**Preparatory tasks**
- Identify an existing CP server

**Configuration tasks**
- Establish TCP/IP connection between CP server and SFCFS cluster
- (OR) Set up a CP server
- Install and configure VCS or SFHA on CP server systems
- Establish TCP/IP connection between CP server and SFCFS cluster
- If SFCFS cluster is configured in secure mode, configure CP server in secure mode
- If the CP server is clustered, set up shared storage for the CP server
- Run the `configure_cps` utility and follow the prompts (or) Manually configure CP server
- For the disks that will serve as coordination points:
  - Initialize disks as VxVM disks and Check disks for I/O fencing compliance

**Configuration tasks**
- Use one of the following methods:
  - Run `installsfcs -fencing`, choose option 1, and follow the prompts
  - Edit the values in the response file you created and use them with `installsfcs -responsefile` command
  - Manually configure server-based I/O fencing

*Figure 7-3 illustrates a high-level flowchart to configure non-SCSI3 server-based I/O fencing for the Storage Foundation Cluster File System cluster in virtual environments that do not support SCSI-3 PR.*
Figure 7-3  Workflow to configure non-SCSI3 server-based I/O fencing

After you perform the preparatory tasks, you can use any of the following methods to configure I/O fencing:
Using the installsfcs

See “Setting up disk-based I/O fencing using installsfcs” on page 147.

See “Setting up server-based I/O fencing using installsfcs” on page 159.

See “Setting up non-SCSI3 server-based I/O fencing using installsfcs” on page 169.

Using the Web-based installer

Note: The Web-based installer supports only the disk-based fencing configuration.

See “Configuring Storage Foundation Cluster File System using the Web-based installer” on page 131.

Using response files

See “Response file variables to configure disk-based I/O fencing” on page 396.

See “Response file variables to configure server-based I/O fencing” on page 398.

See “Response file variables to configure server-based I/O fencing” on page 398.

See “Configuring I/O fencing using response files” on page 395.

Manually editing configuration files

See “Setting up disk-based I/O fencing manually” on page 154.

See “Setting up server-based I/O fencing manually” on page 169.

See “Setting up non-SCSI3 fencing in virtual environments manually” on page 180.

Typical SFCFS cluster configuration with server-based I/O fencing

Figure 7-4 displays a configuration using a SFCFS cluster (with two nodes), a single CP server, and two coordinator disks. The nodes within the SFCFS cluster are connected to and communicate with each other using LLT links.
Recommended CP server configurations

Following are the recommended CP server configurations:

- Multiple application clusters use three CP servers as their coordination points. See Figure 7-5 on page 94.

- Multiple application clusters use a single CP server and multiple pairs of coordinator disks (two) as their coordination points. See Figure 7-6 on page 95.

- Multiple application clusters use a single CP server as their coordination point. This single coordination point fencing configuration must use a highly available CP server that is configured on an SFHA cluster as its coordination point. See Figure 7-7 on page 95.

**Warning:** In a single CP server fencing configuration, arbitration facility is not available during a failover of the CP server in the SFHA cluster. So, if a network partition occurs on any application cluster during the CP server failover, the application cluster is brought down.
Although the recommended CP server configurations use three coordination points, you can use more than three (must be an odd number) coordination points for I/O fencing. In a configuration where multiple application clusters share a common set of CP server coordination points, the application cluster as well as the CP server use a Universally Unique Identifier (UUID) to uniquely identify an application cluster.

Figure 7-5 displays a configuration using three CP servers that are connected to multiple application clusters.

**Figure 7-5** Three CP servers connecting to multiple application clusters

![Diagram of three CP servers connecting to multiple application clusters]

Figure 7-6 displays a configuration using a single CP server that is connected to multiple application clusters with each application cluster also using two coordinator disks.
**Figure 7-6** Single CP server with two coordinator disks for each application cluster

Planning your CP server setup

Follow the planning instructions to set up CP server for server-based I/O fencing.

To plan your CP server setup

1. Decide whether you want to host the CP server on a single-node VCS cluster, or on an SFHA cluster.
   Symantec recommends hosting the CP server on an SFHA cluster.

2. If you host the CP server on an SFHA cluster, review the following information. Make sure you make the decisions and meet these prerequisites when you set up the CP server:
   - You must configure fencing in enabled mode during the SFHA configuration.
   - You must set up shared storage for the CP server database during your CP server setup.
Decide whether you want to configure server-based fencing for the SFCFS cluster (application cluster) with a single CP server as coordination point or with at least three coordination points.

Symantec recommends using at least three coordination points.

3 Decide whether you want to configure the CP server cluster in secure mode using the Symantec Product Authentication Service (AT).

Symantec recommends configuring the CP server cluster in secure mode. Setting up AT secures the communication between the CP server and its clients (SFCFS clusters). It also secures the HAD communication on the CP server cluster, and makes the authentication broker highly available.

4 Set up the hardware and network for your CP server.

See “CP server requirements” on page 45.

5 Have the following information handy for CP server configuration:

- Name for the CP server
  The CP server name should not contain any special characters.

- Port number for the CP server
  Allocate a TCP/IP port for use by the CP server.
  Valid port range is between 49152 and 65535. The default port number is 14250.

- Virtual IP address, network interface, netmask, and networkhosts for the CP server

Installing the CP server using the installer

Perform the following procedure to install and configure VCS or SFHA on CP server systems.

To install and configure VCS or SFHA on the CP server systems

- Depending on whether your CP server uses a single system or multiple systems, perform the following tasks:
CP server setup uses a single system

Install and configure VCS to create a single-node VCS cluster.

Meet the following requirements for CP server:

- During installation, make sure to select all depots for installation. The VRTScps depot is installed only if you select to install all depots.
- During configuration, make sure to configure LLT and GAB.
- During configuration, set up the cluster in secure mode if you want secure communication between the CP server and the SFCFS cluster (application cluster).

See the *Veritas Cluster Server Installation Guide* for instructions on installing and configuring VCS.

Proceed to configure the CP server.

See “Configuring the CP server using the configuration utility” on page 100.

See “Configuring the CP server manually” on page 108.

CP server setup uses multiple systems

Install and configure SFHA to create an SFHA cluster. This makes the CP server highly available.

Meet the following requirements for CP server:

- During installation, make sure to select all depots for installation. The VRTScps depot is installed only if you select to install all depots.
- During configuration, set up the cluster in secure mode if you want secure communication between the CP server and the SFCFS cluster (application cluster).
  
  See “Preparing to configure the clusters in secure mode” on page 73.
- During configuration, configure disk-based fencing (scsi3 mode).

See the *Veritas Storage Foundation and High Availability Installation Guide* for instructions on installing and configuring SFHA.

Proceed to set up shared storage for the CP server database.

---

**Configuring the CP server cluster in secure mode**

You must configure security on the CP server only if you want to secure the communication between the CP server and the SFCFS cluster (CP client).

This step secures the HAD communication on the CP server cluster, and makes the authentication broker highly available.

---

*Note:* If you already configured Symantec Product Authentication Service (AT) during VCS configuration, you can skip this section.
To configure the CP server cluster in secure mode

- Run the installer as follows to configure the CP server cluster in secure mode:

  `# installsfcs -security`

  See “Preparing to configure the clusters in secure mode” on page 73.

Setting up shared storage for the CP server database

Symantec recommends that you create a mirrored volume for the CP server database and that you use the vxfs file system type.

If you configured SFHA on the CP server cluster, perform the following procedure to set up shared storage for the CP server database.

To set up shared storage for the CP server database

1. Create a disk group containing the disks. You require two disks to create a mirrored volume.

   For example:

   `# vxdg init cps_dg disk1 disk2`

2. Import the disk group if it's not already imported.

   For example:

   `# vxdg import cps_dg`
3  Create a mirrored volume over the disk group.
   For example:

   # vxassist -g cps_dg make cps_vol volume_size layout=mirror

4  Create a file system over the volume.
   The CP server configuration utility only supports vxfs file system type. If you use an alternate file system, then you must configure CP server manually.
   Depending on the operating system that your CP server runs, enter the following command:

   AIX           # mkfs -V vxfs /dev/vx/rdsk/cps_dg/cps_volume
   HP-UX         # mkfs -F vxfs /dev/vx/rdsk/cps_dg/cps_volume
   Linux         # mkfs -t vxfs /dev/vx/rdsk/cps_dg/cps_volume
   Solaris       # mkfs -F vxfs /dev/vx/rdsk/cps_dg/cps_volume

Configuring the CP server using the configuration utility

The CP server configuration utility (configure_cps.pl) is part of the VRTScps depot.

Perform one of the following procedures:

For CP servers on single-node VCS cluster:

   See “To configure the CP server on a single-node VCS cluster” on page 100.

For CP servers on an SFHA cluster:

   See “To configure the CP server on an SFHA cluster” on page 104.

**To configure the CP server on a single-node VCS cluster**

1  Verify that the VRTScps depot is installed on the node.

2  Run the CP server configuration script on the node where you want to configure the CP server:

   # /opt/VRTScps/bin/configure_cps.pl
3 Enter 1 at the prompt to configure CP server on a single-node VCS cluster.
   The configuration utility then runs the following preconfiguration checks:
   - Checks to see if a single-node VCS cluster is running with the supported platform.
     The CP server requires VCS to be installed and configured before its configuration.
   - Checks to see if the CP server is already configured on the system.
     If the CP server is already configured, then the configuration utility informs the user and requests that the user unconfigure the CP server before trying to configure it.

4 Enter the name of the CP server.
   Enter the name of the CP Server: mycps1.symantecexample.com

5 Enter a valid virtual IP address on which the CP server process should depend on.
   Enter a valid Virtual IP address on which the CP Server process should depend on:
   10.209.83.85
   You can also use IPv6 address.

6 Enter the CP server port number or press Enter to accept the default value (14250).
   Enter a port number in range [49152, 65535], or press <enter> for default port (14250):
Choose whether the communication between the CP server and the SFCFS clusters has to be made secure.

If you have not configured the CP server cluster in secure mode, enter \texttt{n} at the prompt.

\textbf{Warning:} If the CP server cluster is not configured in secure mode, and if you enter \texttt{y}, then the script immediately exits. You must configure the CP server cluster in secure mode and rerun the CP server configuration script.

Veritas recommends secure communication between the CP server and application clusters. Enabling security requires Symantec Product Authentication Service to be installed and configured on the cluster.

Do you want to enable Security for the communications? (\texttt{y/n}) (Default:\texttt{y}) :

Enter the absolute path of the CP server database or press Enter to accept the default value (/\texttt{etc/VRTScps/db}).

CP Server uses an internal database to store the client information.

Note: As the CP Server is being configured on a single node VCS, the database can reside on local file system.

Enter absolute path of the database (Default:/\texttt{etc/VRTScps/db}) :

Verify and confirm the CP server configuration information.

Following is the CP Server configuration information:

\begin{itemize}
  \item \texttt{CP Server Name: mycps1.symantecexample.com}
  \item \texttt{CP Server Virtual IP: 10.209.83.85}
  \item \texttt{CP Server Port: 14250}
  \item \texttt{CP Server Security : 1}
  \item \texttt{CP Server Database Dir: /etc/VRTScps/db}
\end{itemize}

Press \texttt{b} if you want to change the configuration, <enter> to continue :
10 The configuration utility proceeds with the configuration process, and creates a vxcps.conf configuration file.

Successfully generated the /etc/vxcps.conf configuration file.
Successfully created directory /etc/VRTScps/db.

Configuring CP Server Service Group (CPSSG) for this cluster
----------------------------------------------

NOTE: Please ensure that the supplied network interface is a public NIC

11 Enter a valid network interface for the virtual IP address for the CP server process.

Enter a valid network interface for virtual IP 10.209.83.85 on mycps1.symantecexample.com: lan0

12 Enter networkhosts information for the NIC resource.

Symantec recommends configuring NetworkHosts attribute to ensure NIC resource to be online always.
Do you want to add NetworkHosts attribute for the NIC resource lan0 on system mycps1? [y/n] : y
Enter a valid IP address to configure NetworkHosts for NIC lan0 on system mycps1 : 10.209.83.86
Do you want to add another Network Host? [y/n] : n

13 Enter the netmask for the virtual IP address. For example:

Enter the netmask for virtual IP 10.209.83.85 : 255.255.252.0
After the configuration process has completed, a success message appears. For example:

Successfully added the CPSSG service group to VCS configuration. Bringing the CPSSG service group online. Please wait...

The Veritas Coordination Point Server has been configured on your system.

Run the `hagrp -state` command to ensure that the CPSSG service group has been added. For example:

```
# hagrp -state CPSSG
```

It also generates the configuration file for CP server (/etc/vxcps.conf). The configuration utility adds the vxcpserv process and other resources to the VCS configuration in the CP server service group (CPSSG). For information about the CPSSG, refer to the *Veritas Storage Foundation Cluster File System Administrator's Guide*. In addition, the main.cf samples contain details about the vxcpserv resource and its dependencies.

To configure the CP server on an SFHA cluster

1. Verify that the VRTScps depot is installed on each node.
2. Make sure that you have configured passwordless ssh or remsh on the CP server cluster nodes.
3. Run the CP server configuration script on the node where you want to configure the CP server:

   ```
   # /opt/VRTScps/bin/configure_cps.pl [-n]
   ```

   The CP server configuration utility uses ssh by default to communicate between systems. Use the `-n` option for remsh communication.
4. Enter 2 at the prompt to configure CP server on an SFHA cluster. The configuration utility then runs the following preconfiguration checks:

   - Checks to see if an SFHA cluster is running with the supported platform.
The CP server requires SFHA to be installed and configured before its configuration.

- Checks to see if the CP server is already configured on the system.
  If the CP server is already configured, then the configuration utility informs the user and requests that the user unconfigure the CP server before trying to configure it.

5 Enter the name of the CP server.

Enter the name of the CP Server: mycps1.symantecexample.com

6 Enter a valid virtual IP address on which the CP server process should depend on.

Enter a valid Virtual IP address on which the CP Server process should depend on: 10.209.83.85

You can also use IPv6 address.

7 Enter the CP server port number or press Enter to accept the default value (14250).

Enter a port number in range [49152, 65535], or press <enter> for default port (14250):

8 Choose whether the communication between the CP server and the SFCFS clusters has to be made secure.

If you have not configured the CP server cluster in secure mode, enter n at the prompt.

---

**Warning:** If the CP server cluster is not configured in secure mode, and if you enter y, then the script immediately exits. You must configure the CP server cluster in secure mode and rerun the CP server configuration script.

---

Veritas recommends secure communication between the CP server and application clusters. Enabling security requires Symantec Product Authentication Service to be installed and configured on the cluster.

Do you want to enable Security for the communications? (y/n) (Default:y) : 

Preparing to configure SFCFS

Setting up the CP server
9 Enter the absolute path of the CP server database or press Enter to accept the default value (/etc/VRTScps/db).

CP Server uses an internal database to store the client information.

Note: As the CP Server is being configured on SFHA cluster, the database should reside on shared storage with vxfs file system.

Please refer to documentation for information on setting up of shared storage for CP server database.

Enter absolute path of the database (Default:/etc/VRTScps/db):

10 Verify and confirm the CP server configuration information.

Following is the CP Server configuration information:

-------------------------------------------------
(a)CP Server Name: mycps1.symantecexample.com
(b)CP Server Virtual IP: 10.209.83.85
(c)CP Server Port: 14250
(d)CP Server Security : 1
(e)CP Server Database Dir: /etc/VRTScps/db
-------------------------------------------------

Press b if you want to change the configuration, <enter> to continue :

11 The configuration utility proceeds with the configuration process, and creates a vxcps.conf configuration file on each node.

The following output is for one node:

Successfully generated the /etc/vxcps.conf configuration file.
Successfully created directory /etc/VRTScps/db.
Creating mount point /etc/VRTScps/db on mycps1.symantecexample.com.
Copying configuration file /etc/vxcps.conf to mycps1.symantecexample.com

Configuring CP Server Service Group (CPSSG) for this cluster
12 Confirm whether you use the same NIC name for the virtual IP on all the systems in the cluster.

Is the name of NIC for virtual IP 10.209.83.85 same on all the systems? [y/n] : y

NOTE: Please ensure that the supplied network interface is a public NIC

13 Enter a valid network interface for the virtual IP address for the CP server process.

Enter a valid interface for virtual IP 10.209.83.85 on all the systems : lan0

14 Enter networkhosts information for the NIC resource.

Symantec recommends configuring NetworkHosts attribute to ensure NIC resource to be online always.
Do you want to add NetworkHosts attribute for the NIC resource lan0 on system mycps1? [y/n] : y
Enter a valid IP address to configure NetworkHosts for NIC lan0 on system mycps1 : 10.209.83.86
Do you want to add another Network Host ?[y/n] : n

15 Enter the netmask for the virtual IP address.

Enter the netmask for virtual IP 10.209.83.85 : 255.255.252.0

16 Enter the name of the disk group for the CP server database.

Enter the name of diskgroup for cps database : cps_dg

17 Enter the name of the volume that is created on the above disk group.

Enter the name of volume created on diskgroup cps_dg : cps_volume
After the configuration process has completed, a success message appears. For example:

```
Successfully added the CPSSG service group to VCS configuration. Bringing the CPSSG service group online. Please wait...
```

The Veritas Coordination Point Server has been configured on your system.

Run the `hagrp -state` command to ensure that the CPSSG service group has been added. For example:

```
# hagrp -state CPSSG
```

<table>
<thead>
<tr>
<th>#Group</th>
<th>Attribute</th>
<th>System</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPSSG</td>
<td>State</td>
<td>mycps1.symantecexample.com</td>
<td>ONLINE</td>
</tr>
<tr>
<td>CPSSG</td>
<td>State</td>
<td>mycps2.symantecexample.com</td>
<td>OFFLINE</td>
</tr>
</tbody>
</table>

It also generates the configuration file for CP server (/etc/vxcps.conf).

The configuration utility adds the vxcpserv process and other resources to the VCS configuration in the CP server service group (CPSSG).

For information about the CPSSG, refer to the *Veritas Storage Foundation Cluster File System Administrator's Guide*.

In addition, the main.cf samples contain details about the vxcpserv resource and its dependencies.

**Configuring the CP server manually**

Perform the following steps to manually configure the CP server.

**To manually configure the CP server**

1. Stop VCS on each node in the CP server cluster using the following command:
   ```
   # hastop -local
   ```

2. Edit the `main.cf` file to add the CPSSG service group on any node. Use the CPSSG service group in the main.cf as an example:

Customize the resources under the CPSSG service group as per your configuration.
3 Verify the main.cf file using the following command:

```
# hacf -verify /etc/VRTSvcs/conf/config
```

If successfully verified, copy this main.cf to all other cluster nodes.

4 Create the /etc/vxcps.conf file using the sample configuration file provided at /etc/vxcps/vxcps.conf.sample.

Based on whether you have configured the CP server cluster in secure mode or not, do the following:

- For a CP server cluster which is configured in secure mode, edit the /etc/vxcps.conf file to set security=1.
- For a CP server cluster which is not configured in secure mode, edit the /etc/vxcps.conf file to set security=0.

Symantec recommends enabling security for communication between CP server and the application clusters.

5 Start VCS on all the cluster nodes.

```
# hastart
```

6 Verify that the CP server service group (CPSSG) is online.

```
# hagrp -state CPSSG
```

Output similar to the following appears:

```
# Group Attribute System Value
CPSSG State mycps1.symantecexample.com |ONLINE|
```

**Verifying the CP server configuration**

Perform the following steps to verify the CP server configuration.

**To verify the CP server configuration**

1 Verify that the following configuration files are updated with the information you provided during the CP server configuration process:

- /etc/vxcps.conf (CP server configuration file)
- /etc/VRTSvcs/conf/config/main.cf (VCS configuration file)
Preparing to configure SFCFS

Setting up the CP server

- /etc/VRTScps/db (default location for CP server database)

2 Run the `cpsadm` command to check if the vxcpserv process is listening on the configured Virtual IP.

```bash
# cpsadm -s cp_server -a ping_cps
```

where `cp_server` is the virtual IP address or the virtual hostname of the CP server.
Configuring Veritas Storage Foundation Cluster File System

This chapter includes the following topics:

■ Configuring Veritas Storage Foundation Cluster File System using the script-based installer
■ Configuring Storage Foundation Cluster File System using the Web-based installer
■ Configuring Veritas Storage Foundation Cluster File System manually
■ Configuring the SFDB repository database after installation

Configuring Veritas Storage Foundation Cluster File System using the script-based installer

Overview of tasks to configure Storage Foundation Cluster File System using the script-based installer

Overview of tasks to configure Storage Foundation Cluster File System using the script-based installer lists the tasks that are involved in configuring Storage Foundation Cluster File System using the script-based installer.
Table 8-1  
Tasks to configure Storage Foundation Cluster File System using the script-based installer

Starting the software configuration

You can configure Storage Foundation Cluster File System using the Veritas product installer or the installsfcfs.
To configure Storage Foundation Cluster File System using the product installer

1. Confirm that you are logged in as the superuser and that you have mounted the product disc.

2. Start the installer.

   
   ```bash
   # ./installer
   ```

   The installer starts the product installation program with a copyright message and specifies the directory where the logs are created.

3. From the opening Selection Menu, choose: c for "Configure an Installed Product."

4. From the displayed list of products to configure, choose the corresponding number for:

To configure Storage Foundation Cluster File System using the installsfcfs program

1. Confirm that you are logged in as the superuser.

2. Start the installsfcfs program.

   ```bash
   # /opt/VRTS/install/installsfcfs -configure
   ```

   The installer begins with a copyright message and specifies the directory where the logs are created.

Specifying systems for configuration

The installer prompts for the system names on which you want to configure Storage Foundation Cluster File System. The installer performs an initial check on the systems that you specify.

To specify system names for configuration

1. Enter the names of the systems where you want to configure Storage Foundation Cluster File System.

   Enter the operating_system system names separated by spaces: [q,?] (galaxy) galaxy nebula

2. Review the output as the installer verifies the systems you specify.

   The installer does the following tasks:

   - Checks that the local node running the installer can communicate with remote nodes
     If the installer finds ssh binaries, it confirms that ssh can operate without requests for passwords or passphrases.
■ Makes sure that the systems are running with the supported operating system
■ Checks whether Storage Foundation Cluster File System is installed
■ Exits if Veritas Storage Foundation Cluster File System 5.1 SP1 is not installed

3 Review the installer output about the I/O fencing configuration and confirm whether you want to configure fencing in enabled mode.

Do you want to configure I/O Fencing in enabled mode? [y,n,q,?] (y)

See “About planning to configure I/O fencing” on page 88.

Configuring the cluster name and ID

Enter the cluster information when the installer prompts you.

To configure the cluster

1 Review the configuration instructions that the installer presents.
2 Enter the unique cluster name and cluster ID.

   Enter the unique cluster name: [q,?] clus1
   Enter a unique Cluster ID number between 0-65535: [b,q,?] 7

Configuring private heartbeat links

You now configure the private heartbeats that LLT uses. VCS provides the option to use LLT over Ethernet or over UDP (User Datagram Protocol). Symantec recommends that you configure heartbeat links that use LLT over Ethernet, unless hardware requirements force you to use LLT over UDP. If you want to configure LLT over UDP, make sure you meet the prerequisites.

See “Using the UDP layer for LLT” on page 489.

The following procedure helps you configure LLT over Ethernet.

To configure private heartbeat links

1 Choose one of the following options at the installer prompt based on whether you want to configure LLT over Ethernet or UDP.

   Option 1: LLT over Ethernet (answer installer questions)
   Enter the heartbeat link details at the installer prompt to configure LLT over Ethernet.
   Skip to step 2.
■ Option 2: LLT over UDP (answer installer questions)
Make sure that each NIC you want to use as heartbeat link has an IP address configured. Enter the heartbeat link details at the installer prompt to configure LLT over UDP. If you had not already configured IP addresses to the NICs, the installer provides you an option to detect the IP address for a given NIC.
Skip to step 3.

■ Option 3: LLT over Ethernet (allow installer to detect)
Allow the installer to automatically detect the heartbeat link details to configure LLT over Ethernet. The installer tries to detect all connected links between all systems.
Skip to step 5.

2 If you chose option 1, enter the network interface card details for the private heartbeat links.

The installer discovers and lists the network interface cards. You can use either the standard interfaces or the aggregated interfaces (bonded NICs).

You must not enter the network interface card that is used for the public network (typically lan0.)

Enter the NIC for the first private heartbeat link on galaxy:
[b,q,?] lan0
lan0 has an IP address configured on it. It could be a public NIC on galaxy.
Are you sure you want to use lan0 for the first private heartbeat link? [y,n,q,b,?] (n) y
Would you like to configure a second private heartbeat link? [y,n,q,b,?] (y)
Enter the NIC for the second private heartbeat link on galaxy:
[b,q,?] lan1
lan1 has an IP address configured on it. It could be a public NIC on galaxy.
Are you sure you want to use lan1 for the second private heartbeat link? [y,n,q,b,?] (n) y
Would you like to configure a third private heartbeat link? [y,n,q,b,?] (n)
Do you want to configure an additional low priority heartbeat link? [y,n,q,b,?] (n)
3  If you chose option 2, enter the NIC details for the private heartbeat links. This step uses examples such as `private_NIC1` or `private_NIC2` to refer to the available names of the NICs.

Enter the NIC for the first private heartbeat NIC on galaxy: [b,q,?] `private_NIC1`
Do you want to use address 192.168.0.1 for the first private heartbeat link on galaxy: [y,n,q,b,?] (y)
Enter the UDP port for the first private heartbeat link on galaxy: [b,q,?] (50000) ?
Would you like to configure a second private heartbeat link? [y,n,q,b,?] (y)
Enter the NIC for the second private heartbeat NIC on galaxy: [b,q,?] `private_NIC2`
Do you want to use address 192.168.1.1 for the second private heartbeat link on galaxy: [y,n,q,b,?] (y)
Enter the UDP port for the second private heartbeat link on galaxy: [b,q,?] (50001) ?
Do you want to configure an additional low priority heartbeat link? [y,n,q,b,?] (n) y
Enter the NIC for the low priority heartbeat link on galaxy: [b,q,?] (private_NIC0)
Do you want to use address 192.168.3.1 for the low priority heartbeat link on galaxy: [y,n,q,b,?] (y)
Enter the UDP port for the low priority heartbeat link on galaxy: [b,q,?] (50004)

4  Choose whether to use the same NIC details to configure private heartbeat links on other systems.

Are you using the same NICs for private heartbeat links on all systems? [y,n,q,b,?] (y)

If you want to use the NIC details that you entered for galaxy, make sure the same NICs are available on each system. Then, enter y at the prompt.

For LLT over UDP, if you want to use the same NICs on other systems, you still must enter unique IP addresses on each NIC for other systems.

If the NIC device names are different on some of the systems, enter n. Provide the NIC details for each system as the program prompts.
5 If you chose option 3, the installer detects NICs on each system and network links, and sets link priority.

If the installer fails to detect heartbeat links or fails to find any high-priority links, then choose option 1 or option 2 to manually configure the heartbeat links.

See step 2 for option 1, or step 3 for option 2.

6 Verify and confirm the information that the installer summarizes.

Configuring the virtual IP of the cluster

You can configure the virtual IP of the cluster to use to connect to the Cluster Manager (Java Console) or to specify in the RemoteGroup resource.

See the Veritas Cluster Server Administrator’s Guide for information on the Cluster Manager.

See the Veritas Cluster Server Bundled Agents Reference Guide for information on the RemoteGroup agent.

To configure the virtual IP of the cluster

1 Review the required information to configure the virtual IP of the cluster.

2 To configure virtual IP, enter y at the prompt.

3 Confirm whether you want to use the discovered public NIC on the first system.

Do one of the following:

- If the discovered NIC is the one to use, press Enter.
- If you want to use a different NIC, type the name of a NIC to use and press Enter.

Active NIC devices discovered on galaxy: lan0
Enter the NIC for Virtual IP of the Cluster to use on galaxy: [b,q,?] (lan0)

4 Confirm whether you want to use the same public NIC on all nodes.

Do one of the following:

- If all nodes use the same public NIC, enter y.
- If unique NICs are used, enter n and enter a NIC for each node.
Is lan0 to be the public NIC used by all systems [y,n,q,b,?] (y)

5 Enter the virtual IP address for the cluster.

You can enter either an IPv4 address or an IPv6 address.

For IPv4:

- Enter the virtual IP address.

  Enter the Virtual IP address for the Cluster: [b,q,?] **192.168.1.16**

- Confirm the default netmask or enter another one:

  Enter the netmask for IP 192.168.1.16: [b,q,?] (255.255.240.0)

- Enter the NetworkHosts IP addresses that are separated with spaces for checking the connections.

  Enter the NetworkHosts IP addresses, separated by spaces: [b,q,?] **192.168.1.17**

- Verify and confirm the Cluster Virtual IP information.

  Cluster Virtual IP verification:

  NIC: lan0
  IP: 192.168.1.16
  Netmask: 255.255.240.0
  NetworkHosts: 192.168.1.17

  Is this information correct? [y,n,q] (y)
For IPv6

- Enter the virtual IP address.

  Enter the Virtual IP address for the Cluster: 

- Enter the prefix for the virtual IPv6 address you provided. For example:

  Enter the Prefix for IP 

- Enter the NetworkHosts IP addresses that are separated with spaces for checking the connections.

  Enter the NetworkHosts IP addresses, separated by spaces: [b,q,?] \texttt{2001:db8::1 2001:db8::2}

- Verify and confirm the Cluster Virtual IP information.

  Cluster Virtual IP verification:

  NIC: \texttt{lan0} 
  Prefix: 64

  NetworkHosts: 2001:db8::1 2001:db8::2

  Is this information correct? [y,n,q] (y)

Configuring the cluster in secure mode

If you want to configure the cluster in secure mode, make sure that you meet the prerequisites for secure cluster configuration.

The installer provides different configuration modes to configure a secure cluster. Make sure that you completed the pre-configuration tasks for the configuration mode that you want to choose.

See “Preparing to configure the clusters in secure mode” on page 73.

To configure the cluster in secure mode

   Would you like to configure VCS to use Symantec Security Services? [y,n,q] (n) \texttt{y}
If you want to configure the cluster in secure mode, make sure you meet the prerequisites and enter `y`.

If you do not want to configure the cluster in secure mode, enter `n`. You must add VCS users when the configuration program prompts. See “Adding VCS users” on page 123.

2. Select one of the options to enable security.

Before you choose any of the options, make sure that all the nodes in the cluster can successfully ping the root broker system.

Select the Security option you would like to perform [1-3,b,q,?] (1)

Security Menu

1) Configure security completely automatically
2) Provide AB credentials using BLOBs
3) Provide AB credentials without using BLOBs
b) Back to previous menu

Review the following configuration modes. Based on the configuration that you want to use, enter one of the following values:
Based on the root broker you want to use, do one of the following:

- To use an external root broker:
  Enter the name of the root broker system when prompted.
  Requires remote access to the root broker. Make sure that all
  the nodes in the cluster can successfully ping the root broker
  system.
  Review the output as the installer verifies communication
  with the root broker system, checks vxatd process and version,
  and checks security domain.

- To configure one of the nodes as root broker:
  - Press Enter at the following installer prompt:

    If you already have an external
    RB (Root Broker) installed and configured, enter the RB name, or press Enter to skip: [b]

    Choose the node that the installer must configure as root
    and authentication broker. The installer configures the
    other nodes as authentication brokers.
    At the installer prompt, you can choose the first node in
    the cluster to configure as RAB, or you can enter n to
    configure another node as RAB. For example:

    Do you want to configure <galaxy> as RAB,
    and other nodes as AB? [y, n, q, b] (y) n
    Enter the node name which you want to
    configure as RAB: nebula

Option 2. Semiautomatic configuration

Enter the path of the encrypted file (BLOB file) for each node
when prompted.
Enter the following Root Broker information as the installer prompts you:

Enter root broker name: [b]
east.symantecexample.com
Enter root broker FQDN: [b]
symantecexample.com
Enter the root broker domain name for the Authentication Broker's identity: [b]
root@east.symantecexample.com
Enter root broker port: [b] 2821
Enter path to the locally accessible root hash [b]
/var/tmp/installvcs-200910221810ROA/root_hash

Enter the following Authentication Broker information as the installer prompts you for each node:

Enter Authentication broker's identity on galaxy [b]
(galaxy.symantecexample.com)
galaxy.symantecexample.com
Enter the password for the Authentication broker's identity on galaxy:
Enter Authentication broker's identity on nebula [b]
(nebula.symantecexample.com)
nebula.symantecexample.com
Enter the password for the Authentication broker's identity on nebula:

After you provide the required information to configure the cluster in secure mode, the program prompts you to configure SMTP email notification.

Note that the installer does not prompt you to add VCS users if you configured the cluster in secure mode. However, you must add VCS users later.

See the *Veritas Cluster Server Administrator’s Guide* for more information.
Adding VCS users

If you have enabled Symantec Product Authentication Service, you do not need to add VCS users now. Otherwise, on systems operating under an English locale, you can add VCS users at this time.

To add VCS users

1. Review the required information to add VCS users.
2. Reset the password for the Admin user, if necessary.

   Do you want to set the username and/or password for the Admin user (default username = 'admin', password='password')? [y,n,q] (n) y
   Enter the user name: [b,q,?] (admin)
   Enter the password:
   Enter again:

3. To add a user, enter y at the prompt.

   Do you want to add another user to the cluster? [y,n,q] (y)

4. Enter the user's name, password, and level of privileges.

   Enter the user name: [b,q,?] smith
   Enter New Password:*******
   Enter Again:*******
   Enter the privilege for user smith (A=Administrator, O=Operator, G=Guest): [b,q,?] a

5. Enter n at the prompt if you have finished adding users.

   Would you like to add another user? [y,n,q] (n)

6. Review the summary of the newly added users and confirm the information.

Configuring SMTP email notification

You can choose to configure VCS to send event notifications to SMTP email services. You need to provide the SMTP server name and email addresses of people to be notified. Note that you can also configure the notification after installation. Refer to the Veritas Cluster Server Administrator's Guide for more information.
To configure SMTP email notification

1. Review the required information to configure the SMTP email notification.

2. Specify whether you want to configure the SMTP notification.

   Do you want to configure SMTP notification? [y,n,q,?] (n) y

   If you do not want to configure the SMTP notification, you can skip to the next configuration option.

   See “Configuring SNMP trap notification” on page 125.

3. Provide information to configure SMTP notification.

   Provide the following information:
   - Enter the NIC information.
     
     Active NIC devices discovered on galaxy: lan0
     Enter the NIC for the VCS Notifier to use on galaxy: [b,q,?] (lan0)
     Is lan0 to be the public NIC used by all systems? [y,n,q,b,?] (y)
   - Enter the SMTP server's host name.
     
     Enter the domain-based hostname of the SMTP server (example: smtp.yourcompany.com): [b,q,?] smtp.example.com
   - Enter the email address of each recipient.
     
     Enter the full email address of the SMTP recipient (example: user@yourcompany.com): [b,q,?] ozzie@example.com
   - Enter the minimum security level of messages to be sent to each recipient.
     
     Enter the minimum severity of events for which mail should be sent to ozzie@example.com [I=Information, W=Warning, E=Error, S=SevereError]: [b,q,?] w

4. Add more SMTP recipients, if necessary.

   - If you want to add another SMTP recipient, enter y and provide the required information at the prompt.

     Would you like to add another SMTP recipient? [y,n,q,b] (n) y

     Enter the full email address of the SMTP recipient
Enter the minimum severity of events for which mail should be sent to harriet@example.com [I=Information, W=Warning, E=Error, S=SevereError]: [b,q,?] E

■ If you do not want to add, answer n.

Would you like to add another SMTP recipient? [y,n,q,b] (n)

5 Verify and confirm the SMTP notification information.

NIC: lan0
SMTP Address: smtp.example.com
Recipient: ozzie@example.com receives email for Warning or higher events
Recipient: harriet@example.com receives email for Error or higher events

Is this information correct? [y,n,q] (y)

Configuring SNMP trap notification

You can choose to configure VCS to send event notifications to SNMP management consoles. You need to provide the SNMP management console name to be notified and message severity levels.

Note that you can also configure the notification after installation.

Refer to the Veritas Cluster Server Administrator’s Guide for more information.

To configure the SNMP trap notification

1 Review the required information to configure the SNMP notification feature of VCS.

2 Specify whether you want to configure the SNMP notification.

Do you want to configure SNMP notification? [y,n,q,?] (n) y

See “Configuring global clusters” on page 127.

3 Provide information to configure SNMP trap notification.

Provide the following information:

■ Enter the NIC information.
Active NIC devices discovered on galaxy: lan0
Enter the NIC for the VCS Notifier to use on galaxy: [b,q,?] (lan0)
Is lan0 to be the public NIC used by all systems? [y,n,q,b,?] (y)

■ Enter the SNMP trap daemon port.
   Enter the SNMP trap daemon port: [b,q,?] (162)

■ Enter the SNMP console system name.
   Enter the SNMP console system name: [b,q,?] saturn

■ Enter the minimum security level of messages to be sent to each console.
   Enter the minimum severity of events for which SNMP traps should be sent to saturn [I=Information, W=Warning, E=Error, S=SevereError]: [b,q,?] E

4 Add more SNMP consoles, if necessary.
■ If you want to add another SNMP console, enter y and provide the required information at the prompt.

   Would you like to add another SNMP console? [y,n,q,b] (n) y
   Enter the SNMP console system name: [b,q,?] jupiter
   Enter the minimum severity of events for which SNMP traps should be sent to jupiter [I=Information, W=Warning, E=Error, S=SevereError]: [b,q,?] S

■ If you do not want to add, answer n.
Would you like to add another SNMP console? [y,n,q,b] (n)

5 Verify and confirm the SNMP notification information.

NIC: lan0

SNMP Port: 162
Console: saturn receives SNMP traps for Error or higher events
Console: jupiter receives SNMP traps for SevereError or higher events

Is this information correct? [y,n,q] (y)

Configuring global clusters

If you had installed a valid HA/DR license, the installer provides you an option to configure this cluster as global cluster.

You can configure global clusters to link clusters at separate locations and enable wide-area failover and disaster recovery. The installer adds basic global cluster information to the VCS configuration file. You must perform additional configuration tasks to set up a global cluster.

See the Veritas Storage Foundation Cluster File System Installation Guide for instructions to set up Storage Foundation Cluster File System global clusters.

Note: If you installed a HA/DR license to set up replicated data cluster or campus cluster, skip this installer option.

To configure the global cluster option

1 Review the required information to configure the global cluster option.

2 Specify whether you want to configure the global cluster option.

Do you want to configure the Global Cluster Option? [y,n,q] (n) y

If you skip this option, the installer proceeds to configure VCS based on the configuration details you provided.
3 Provide information to configure this cluster as global cluster.

The installer prompts you for a NIC, a virtual IP address, value for the netmask, and value for the network hosts.

If you had entered virtual IP address details, the installer discovers the values you entered. You can use the same virtual IP address for global cluster configuration or enter different values.

You can also enter an IPv6 address as a virtual IP address.

4 Verify and confirm the configuration of the global cluster. For example:

For IPv4: Global Cluster Option configuration verification:

NIC: lan0
IP: 192.168.1.16
Netmask: 255.255.240.0

NetworkHosts: 192.168.1.17

Is this information correct? [y,n,q] (y)

For IPv6: Global Cluster Option configuration verification:

NIC: lan0
Prefix: 64

NetworkHosts: 2001:db8::1 2001:db8::2

Is this information correct? [y,n,q] (y)

Completing the VCS configuration

After you enter the Storage Foundation Cluster File System configuration information, the installer prompts to stop the VCS processes to complete the configuration process. The installer continues to create configuration files and copies them to each system. The installer also configures a cluster UUID value for the cluster at the end of the configuration. After the installer successfully configures VCS, it restarts Storage Foundation Cluster File System and its related processes.

If you chose to configure the cluster in secure mode, the installer then does the following before it starts Storage Foundation Cluster File System in secure mode:
Depending on the security mode you chose to set up Authentication Service, the installer does one of the following:

- Creates the security principal
- Executes the encrypted file to create security principal on each node in the cluster

- Creates the VxSS service group
- Creates the Authentication Server credentials on each node in the cluster
- Creates the Web credentials for Storage Foundation Cluster File System users
- Sets up trust with the root broker

To complete the VCS configuration

1. If prompted, press Enter at the following prompt.

   Do you want to stop VCS processes now? [y,n,q,?] (y)

2. Review the output as the installer stops various processes and performs the configuration. The installer then restarts Storage Foundation Cluster File System and its related processes.

3. Enter y at the prompt to send the installation information to Symantec.

   Would you like to send the information about this installation to Symantec to help improve installation in the future? [y,n,q,?] (y) y

4. After the installer configures Storage Foundation Cluster File System successfully, note the location of summary, log, and response files that installer creates.

   The files provide the useful information that can assist you with the configuration and can also assist future configurations.

   - **summary file**: Describes the cluster and its configured resources.
   - **log file**: Details the entire configuration.
   - **response file**: Contains the configuration information that can be used to perform secure or unattended installations on other systems.

   See “Configuring SFCFS using response files” on page 378.
Verifying and updating licenses on the system

After you install Storage Foundation Cluster File System, you can verify the licensing information using the vxlicrep program. You can replace the demo licenses with a permanent license.

See “Checking licensing information on the system” on page 130.

See “Updating product licenses using vxlicinst” on page 130.

Checking licensing information on the system

You can use the vxlicrep program to display information about the licenses on a system.

To check licensing information

1. Navigate to the folder containing the vxlicrep program and enter:

   ```
   # vxlicrep
   ```

2. Review the following output to determine the following information:

   - The license key
   - The type of license
   - The product for which it applies
   - Its expiration date, if any. Demo keys have expiration dates. Permanent keys and site keys do not have expiration dates.

Updating product licenses using vxlicinst

You can use the vxlicinst command to add the Storage Foundation Cluster File System license key on each node. If you have Storage Foundation Cluster File System already installed and configured and you use a demo license, you can replace the demo license.

See “Replacing a Storage Foundation Cluster File System demo license with a permanent license” on page 131.

To update product licenses

- On each node, enter the license key using the command:

  ```
  # vxlicinst -k XXXX-XXXX-XXXX-XXXX-XXXX-XXX
  ```
Replacing a Storage Foundation Cluster File System demo license with a permanent license

When a Storage Foundation Cluster File System demo key license expires, you can replace it with a permanent license using the `vxlicinst(1)` program.

To replace a demo key

1. Make sure you have permissions to log in as root on each of the nodes in the cluster.

2. Shut down Storage Foundation Cluster File System on all nodes in the cluster:
   ```
   # hastop -all -force
   ```
   This command does not shut down any running applications.

3. Enter the permanent license key using the following command on each node:
   ```
   # vxlicinst -k XXXX-XXXX-XXXX-XXXX-XXXX-XXX
   ```

4. Make sure demo licenses are replaced on all cluster nodes before starting Storage Foundation Cluster File System.
   ```
   # vxlicrep
   ```

5. Start Storage Foundation Cluster File System on each node:
   ```
   # hastart
   ```

Configuring Storage Foundation Cluster File System using the Web-based installer

Before you begin to configure Storage Foundation Cluster File System using the Web-based installer, review the configuration requirements.

By default, the communication between the systems is selected as SSH. If SSH is used for communication between systems, the SSH commands execute without prompting for passwords or confirmations.

---

**Note:** If you want to configure server-based I/O fencing, you must either use the script-based installer or manually configure.

---

You can click **Quit** to quit the Web-installer at any time during the configuration process.
To configure Storage Foundation Cluster File System on a cluster

1 Start the Web-based installer.
   See “Starting the Veritas Web-based installer” on page 67.

2 On the Select a task and a product page, select the task and the product as follows:

   **Task** Configure a Product

   **Product** Storage Foundation for Cluster File System or Storage Foundation for Cluster File System/HA

   Click **Next**.

3 On the Select Systems page, enter the system names where you want to configure Storage Foundation Cluster File System, and click **Validate**.

   Example: galaxy nebula

   The installer performs the initial system verification. It checks for the system communication. It also checks for release compatibility, installed product version, platform version, and performs product prechecks.

   Click **Next** after the installer completes the system verification successfully.

4 In the Confirmation dialog box that appears, choose whether or not to configure I/O fencing.

   To configure disk-based I/O fencing, click **Yes**.

   If you want to configure server-based I/O fencing, or if you decide to configure I/O fencing later, click **No**. You can either use the `installsfcfs -fencing` command or manually configure.
5 On the Set Cluster Name/ID page, specify the following information for the cluster.

- **Cluster Name**: Enter a unique cluster name.
- **Cluster ID**: Enter a unique cluster ID.
- **LLT Type**: Select an LLT type from the list. You can choose to configure LLT over UDP or over Ethernet.
  - If you choose **Auto detect over Ethernet**, the installer auto-detects the LLT links over Ethernet. Verify the links and click **Yes** in the Confirmation dialog box. Skip to step 6.
  - If you choose **To configure Storage Foundation Cluster File System on a cluster**, if you click No, you must manually enter the details to configure LLT over Ethernet.
- **Number of Heartbeats**: Choose the number of heartbeat links you want to configure.
- **Low Priority Heartbeat NIC**: Select the check box if you want to configure a low priority link. The installer configures one heartbeat link as low priority link.
- **Unique Heartbeat NICs per system**: For LLT over Ethernet, select the check box if you do not want to use the same NIC details to configure private heartbeat links on other systems.
  - For LLT over UDP, this check box is selected by default.

Click **Next**.

6 On the Set Cluster Heartbeat page, select the heartbeat link details for the LLT type you chose on the Set Cluster Name/ID page.

For **LLT over Ethernet**: Do the following:
- If you are using the same NICs on all the systems, select the NIC for each private heartbeat link.
- If you had selected **Unique Heartbeat NICs per system** on the Set Cluster Name/ID page, provide the NIC details for each system.

For **LLT over UDP**: Select the NIC, Port, and IP address for each private heartbeat link. You must provide these details for each system.

Click **Next**.
7 In the Confirmation dialog box that appears, choose whether or not to configure the cluster in secure mode using Symantec Product Authentication Service (AT).

To configure the cluster in secure mode, click Yes.

If you want to perform this task later, click No. You can use the `installsfcfs -security` command. Go to step To configure Storage Foundation Cluster File System on a cluster.

8 On the Security Options page, choose an option to enable security and specify the required information.

Do not configure security services
Choose this option if you do not want to enable security.

The installer takes you to the next page to configure optional features of Storage Foundation Cluster File System.

Configure security automatically
Choose this option to use an external root broker.

Enter the name of the root broker that is already configured for your enterprise environment, and click Validate. The installer configures the cluster in secure mode.

Configure one node as RAB and the others as AB
Select the system that you want to configure as RAB node.

The installer configures the cluster in secure mode.

Click Next.

9 On the Optional Configuration page, decide the optional VCS features that you want to configure. Click the corresponding tab to specify the details for each option:

**Virtual IP**
- Select the **Configure Virtual IP** check box.
- If each system uses a separate NIC, select the **Configure NICs for every system separately** check box.
- Select the interface on which you want to configure the virtual IP.
- Enter a virtual IP address and value for the netmask.
  Enter the value for the networkhosts.
  You can use an IPv4 or an IPv6 address.

**VCS Users**
- Reset the password for the Admin user, if necessary.
- Click Add to add a new user.
  Specify the user name, password, and user privileges for this user.
SMTP

- Select the Configure SMTP check box.
- If each system uses a separate NIC, select the Configure NICs for every system separately check box.
- If all the systems use the same NIC, select the NIC for the VCS Notifier to be used on all systems. If not, select the NIC to be used by each system.
- In the SMTP Server box, enter the domain-based hostname of the SMTP server. Example: smtp.yourcompany.com
- In the Recipient box, enter the full email address of the SMTP recipient. Example: user@yourcompany.com.
- In the Event list box, select the minimum security level of messages to be sent to each recipient.
- Click Add to add more SMTP recipients, if necessary.

SNMP

- Select the Configure SNMP check box.
- If each system uses a separate NIC, select the Configure NICs for every system separately check box.
- If all the systems use the same NIC, select the NIC for the VCS Notifier to be used on all systems. If not, select the NIC to be used by each system.
- In the SNMP Port box, enter the SNMP trap daemon port: (162).
- In the Console System Name box, enter the SNMP console system name.
- In the Event list box, select the minimum security level of messages to be sent to each console.
- Click Add to add more SNMP consoles, if necessary.

GCO

If you installed a valid HA/DR license, you can now enter the wide-area heartbeat link details for the global cluster that you would set up later.

See the Veritas Storage Foundation Cluster File System Installation Guide for instructions to set up SFCFS global clusters.

- Select the Configure GCO check box.
- If each system uses a separate NIC, select the Configure NICs for every system separately check box.
- Select a NIC.
- Enter a virtual IP address and value for the netmask.
- Enter the value for the networkhosts.
- You can use an IPv4 or an IPv6 address.

Click Next.
10 On the Stop Processes page, click Next after the installer stops all the processes successfully.

11 On the Start Processes page, click Next after the installer performs the configuration based on the details you provided and starts all the processes successfully.

If you did not choose to configure I/O fencing in step To configure Storage Foundation Cluster File System on a cluster, then skip to step To configure Storage Foundation Cluster File System on a cluster. Go to step To configure Storage Foundation Cluster File System on a cluster to configure fencing.

12 On the Select Fencing Type page, specify the following information:

- **Configure disk based fencing**
  Choose the Configure disk based fencing option.

- **Select a Disk Group**
  Select the Create a new disk group option or select one of the disk groups from the list.
  - If you selected one of the disk groups that is listed, the default fencing mechanism for the disk group is dmp.
    Go to step [Unresolved xref].
  - If you selected the Create a new disk group option, make sure you have SCSI-3 PR enabled disks, and click Yes in the confirmation dialog box.
    Click Next. Go to step To configure Storage Foundation Cluster File System on a cluster.

13 On the Create New DG page, specify the following information:

- **New Disk Group Name**
  Enter a name for the new coordinator disk group you want to create.

- **Select Disks**
  Select at least three disks to create the coordinator disk group.
  If you want to select more than three disks, make sure to select an odd number of disks.

- **Fencing Mechanism**
  The default fencing mechanism for the disk group is dmp.
14 Click **Next** to complete the process of configuring Storage Foundation Cluster File System.

On the Completion page, view the summary file, log file, or response file, if needed, to confirm the configuration.

15 Select the checkbox to specify whether you want to send your installation information to Symantec.

Click **Finish**. The installer prompts you for another task.

### Configuring Veritas Storage Foundation Cluster File System manually

You can manually configure different products within Veritas Storage Foundation Cluster File System.

### Configuring Veritas Volume Manager

Use the following procedures to configure Veritas Volume Manager. If you have installed and configured VxVM using the product installer, you do not need to complete the procedures in this section.

For information on setting up VxVM disk groups and volumes after installation, see "Configuring Veritas Volume Manager" in the *Veritas Volume Manager Administrator’s Guide*.

### Configuring Veritas Volume Manager with the installvm script

If you deferred configuring VxVM during installation, you can configure it by running the `installvm` script with the `-configure` option.

**To configure VxVM using the installvm script**

1. Enter the following commands.

```bash
# cd /dvdrom/volume_manager
# ./installvm -configure
```

2. The script runs an initial system check, and will tell you that you cannot configure already configured features such as enclosure-based naming and default disk groups.

3. Decide whether you want to set up the enclosure-based naming scheme:

   Do you want to set up the enclosure-based naming scheme? [y, n, q]
4 You are then asked if you want to set up a default disk group for each system:

Do you want to set up a default disk group for each system? [y, n, q]

5 If you have a VVR license installed, the next phase concerns configuration of VVR:

Do you want to change any of the VVR ports ... [y, n, q]

6 You are now asked questions regarding the frequency of VVR statistics collection.

7 The next phase of the configuration procedure consists of setting up a centrally managed host:

Enable Centralized Management? [y,n,q]

8 If you selected centralized management, you will be asked a series of questions relating to hostnames.

After configuration is complete, the following message displays:

Startup completed successfully on all systems

9 After the installation and configuration of VxVM is complete, you can use the `vxdiskadm` command and the VEA GUI to create disk groups, and to populate these with disks.

See the *Veritas Volume Manager Administrator’s Guide* and the VEA online help for details.

**Converting to a VxVM root disk**

It is possible to select VxVM as a choice for your root disk when performing a new installation using Ignite-UX. Alternatively, you can use the following procedure to achieve VxVM rootability by cloning your LVM root disk using the `vxcp_lvmroot` command.

**To convert to a VxVM root disk**

1 Select the disk to be used as your new VxVM root disk. It is recommended that this disk is internal to the main computer cabinet. If this is currently an LVM disk, then it must be removed from LVM control as follows:

   - Use the `lvremove` command to remove any LVM volumes that are using the disk.
- Use the `vgreduce` command to remove the disk from any LVM volume groups to which it belongs.
- Use the `pvremove` command to erase the LVM disk headers

If the disk to be removed is the last disk in the volume group, use the `vgremove` command to remove the volume group, and then use `pvremove` to erase the LVM disk headers.

If the disk is not currently in use by any volume or volume group, but has been initialized by `pvcreate`, you must still use the `pvremove` command to remove LVM disk headers.

If you want to mirror the root disk across multiple disks, make sure that all the disks are free from LVM control.

2 While booted on the newly upgraded LVM root disk, invoke the `vxcp_lvmroot` command to clone the LVM root disk to the disk(s) you have designated to be the new VxVM root disks. In the following example, `c1t0d0` is used for the target VxVM root disk:

```
# /etc/vx/bin/vxcp_lvmroot -v c1t0d0
```

To additionally create a mirror of the root disk on `c2t0d0`:

```
# /etc/vx/bin/vxcp_lvmroot -v -m c2t0d0 c1t0d0
```

Use of the `-v` (verbose) option is highly recommended. The cloning of the root disk is a lengthy operation, and this option gives a time-stamped progress indication as each volume is copied, and other major events.

3 Use the `setboot` (1M) command to save the hardware path of the new VxVM root disk in the system NVRAM. The disk hardware paths can be found using this command:

```
# ioscan -kfnC disk
```

4 Reboot from the new VxVM root disk. If you created a mirrored root disk, then there is nothing more to do. The LVM root disk safely co-exists with your VxVM root disk, and provides a backup boot target.
5 If desired, you can convert the original LVM root disk into a mirror of your VxVM root disk by using the following commands:

```
# /etc/vx/bin/vxdestroy_lvmroot -v c2t0d0
# /etc/vx/bin/vxrootmir -v c2t0d0
```

Once this operation is complete, the system is running on a completely mirrored VxVM root disk.

6 If later required, you can use the `vxres_lvmroot` command to restore the LVM root disk.

### Starting and enabling the configuration daemon

The VxVM configuration daemon (`vxconfigd`) maintains VxVM disk and disk group configurations. The `vxconfigd` communicates configuration changes to the kernel and modifies configuration information stored on disk.

Startup scripts usually invoke `vxconfigd` at system boot time. The `vxconfigd` daemon must be running for VxVM to operate properly.

The following procedures describe how to check that `vxconfigd` is started, whether it is enabled or disabled, how to start it manually, or how to enable it as required.

To determine whether `vxconfigd` is enabled, use the following command:

```
# vxdctl mode
```

The following message indicates that the `vxconfigd` daemon is running and enabled:

```
mode: enabled
```

This message indicates that `vxconfigd` is not running:

```
mode: not-running
```

This message indicates that `vxconfigd` is running, but not enabled:

```
mode: disabled
```

To start the `vxconfigd` daemon, enter the following command:

```
# vxconfigd
```

To enable the volume daemon, enter the following command:

```
# vxdctl enable
```
Once started, `vxconfigd` automatically becomes a background process.

By default, `vxconfigd` writes error messages to the console. However, you can configure it to write errors to a log file. For more information, see the `vxconfigd(1M)` and `vxdctl(1M)` manual pages.

**Starting the volume I/O daemon**

The volume I/O daemon (`vxiod`) provides extended I/O operations without blocking calling processes. Several `vxiod` daemons are usually started at system boot time after initial installation, and they should be running at all times. The procedure below describes how to verify that the `vxiod` daemons are running, and how to start them if necessary.

To verify that `vxiod` daemons are running, enter the following command:

```
# vxiod
```

The `vxiod` daemon is a kernel thread and is not visible using the `ps` command. If, for example, 16 `vxiod` daemons are running, the following message displays:

```
16 volume I/O daemons running
```

where 16 is the number of `vxiod` daemons currently running. If no `vxiod` daemons are currently running, start some by entering this command:

```
# vxiod set no_of_daemons
```

where the number of daemons ranges from 1 to 16. Symantec recommends that at least one `vxiod` daemon should be run for each CPU in the system.

For more information, see the `vxiod(1M)` manual page.

**Enabling optional cluster support in VxVM**

This release includes an optional cluster feature that enables VxVM to be used in a cluster environment. The cluster functionality in VxVM allows multiple hosts to simultaneously access and manage a set of disks under VxVM control. A cluster is a set of hosts sharing a set of disks; each host is referred to as a node in the cluster.

The VxVM cluster feature requires a license, which can be obtained from your Customer Support channel.
To enable the cluster functionality in VxVM
1. Obtain a license for the VxVM cluster feature.
2. Install the software packages onto each system (node) to be included in the cluster.
3. Create the configuration files required to form a cluster.
4. Start the cluster services.
5. Configure shared disks.

See the *Veritas Volume Manager Administrator’s Guide*.

Converting existing VxVM disk groups to shared disk groups

Use this procedure if you are upgrading from VxVM 3.x to VxVM 5.1 SP1 (or Storage Foundation 3.x to a Storage Foundation product at the 5.1 SP1 level) and you want to convert existing disk groups to shared disk groups.

If you want to convert existing private disk groups to shared disk groups, use the following procedure. Use these steps if you are moving from a single node to a cluster, or if you are already in a cluster and have existing private disk groups.

To convert existing disk groups to shared disk groups
1. Ensure that all systems that are running are part of the same cluster.
2. Start the cluster on all of the nodes on which you are converting the disk groups.
3 Configure the disk groups using the following procedure.

To list all disk groups, use the following command:

```
# vxdg list
```

To deport disk groups to be shared, use the following command:

```
# vxdg deport disk_group_name
```

To import disk groups to be shared, use the following command on the master node:

```
# vxdg -s import disk_group_name
```

This procedure marks the disks in the shared disk groups as shared and stamps them with the ID of the cluster, enabling other nodes to recognize the shared disks.

If dirty region logs exist, ensure they are active. If not, replace them with larger ones.

To display the shared flag for all the shared disk groups, use the following command:

```
# vxdg list
```

The disk groups are now ready to be shared.

4 If the cluster is only running with one node, bring up the other cluster nodes. Enter the `vxdg list` command on each node to display the shared disk groups. This command displays the same list of shared disk groups displayed earlier.

## Configuring shared disks

This section describes how to configure shared disks. If you are installing VxVM for the first time or adding disks to an existing cluster, you need to configure new shared disks. If you are upgrading VxVM, verify that your shared disks still exist.

The shared disks should be configured from one node only. Since the VxVM software cannot tell whether a disk is shared or not, you must specify which are the shared disks.

Make sure that the shared disks are not being accessed from another node while you are performing the configuration. If you start the cluster on the node where you perform the configuration only, you can prevent disk accesses from other nodes because the quorum control reserves the disks for the single node.
Verifying existing shared disks
If you are upgrading from a previous release of VxVM, verify that your shared disk groups still exist.

To verify that your shared disk groups exist
1. Start the cluster on all nodes.
2. Enter the following command on all nodes:
   ```
   # vxdg -s list
   ```
   This displays the existing shared disk groups.

Upgrading in a clustered environment with FastResync set
Upgrading in a clustered environment with FastResync set requires additional steps.

This procedure applies to the following upgrade scenarios:
- Upgrading from VxVM 3.5 to VxVM 5.1 SP1
- Upgrading from VxVM 3.5 Maintenance Pack 4 to VxVM 5.1 SP1

If there are volumes in the shared disk groups with FastResync set (fastresync=on), before beginning the upgrade procedure, reattach each snapshot to its data volume, using this procedure:

To upgrade in a clustered environment when FastResync is set
1. You should run this procedure from the master node; to find out if you are on the master node, enter the command:
   ```
   # vxdctl -c mode
   ```
2. On the master node, list which disk groups are shared by entering:
   ```
   # vxdg -s list
   ```
3. Using the diskgroup names displayed by the previous command, list the disk groups that have volumes on which FastResync is set:
   ```
   # vxprint -g diskgroup -F "%name" -e "v_fastresync"
   ```
4 Reattach each snapshot:

```
# vxassist -g diskgroup -o nofmr snapback snapshot_volume
```

5 If you are upgrading from VxVM 3.5 Maintenance Patch 3 or from VxVM 3.2 Maintenance Patch 5, set FastResync to off for each volume:

```
# vxvol -g diskgroup set fastresync=off volume
```

### Configuring Veritas File System

After installing Veritas File System, you can create a file system on a disk slice or Veritas Volume Manager volume with the `mkfs` command. Before you can use this file system, you must mount it with the `mount` command. You can unmount the file system later with the `umount` command. A file system can be automatically mounted at system boot time if you add an entry for it in the following file:

`/etc/fstab`

The Veritas-specific commands are described in the Veritas File System guides and online manual pages.

See the *Veritas File System Administrator’s Guide*.

### `vxtuneefs` command permissions and Cached Quick I/O

By default, you must have superuser (`root`) privileges to use the

`/opt/VRTS/bin/vxtuneefs` command. The `vxtuneefs` command is a tool that lets you change caching policies to enable Cached Quick I/O and change other file system options. Database administrators can be granted permission to change default file system behavior in order to enable and disable Cached Quick I/O. The system administrator must change the `vxtuneefs` executable permissions as follows:

```
# chown root:dba /opt/VRTS/bin/vxtuneefs
# chmod 4550 /opt/VRTS/bin/vxtuneefs
```

Setting the permissions for `/opt/VRTS/bin/vxtuneefs` to 4550 allows all users in the dba group to use the `vxtuneefs` command to modify caching behavior for Quick I/O files.

For more information, see the *Veritas File System Administrator’s Guide*. 
Configuring the SFDB repository database after installation

If you want to use the Storage Foundation Database (SFDB) tools, you must set up the SFDB repository after installing and configuring SFCFS and Oracle. For SFDB repository set up procedures:

See Veritas Storage Foundation: Storage and Availability Management for Oracle Databases
Configuring SFCFS for data integrity

This chapter includes the following topics:

- Setting up disk-based I/O fencing using installsfcfs
- Setting up disk-based I/O fencing manually
- Setting up server-based I/O fencing using installsfcfs
- Setting up non-SCSI3 server-based I/O fencing using installsfcfs
- Setting up server-based I/O fencing manually
- Setting up non-SCSI3 fencing in virtual environments manually
- Enabling or disabling the preferred fencing policy

Setting up disk-based I/O fencing using installsfcfs

You can configure I/O fencing using the -fencing option of the installsfcfs.

Initializing disks as VxVM disks

Perform the following procedure to initialize disks as VxVM disks.
To initialize disks as VxVM disks

1. List the new external disks or the LUNs as recognized by the operating system. On each node, enter:

   # ioscan -nfC disk
   # insf -e

**Warning:** The HP-UX man page for the `insf` command instructs you to run the command in single-user mode only. You can run `insf -e` in multiuser mode only when no other user accesses any of the device files. This command can change the mode, owner, or group of an existing special (device) file, or unlink and recreate a file. The special files that are currently open may be left in an indeterminate state.

2. To initialize the disks as VxVM disks, use one of the following methods:

   - Use the interactive vxdiskadm utility to initialize the disks as VxVM disks. For more information see the *Veritas Volume Manager Administrator’s Guide*.

   - Use the `vxdisksetup` command to initialize a disk as a VxVM disk.

     ```
     vxdisksetup -i device_name
     ```

     The example specifies the CDS format:

     ```
     # vxdisksetup -i c2t13d0
     ```

     Repeat this command for each disk you intend to use as a coordinator disk.

Configuring disk-based I/O fencing using installsfcs

**Note:** The installer stops and starts Storage Foundation Cluster File System to complete I/O fencing configuration. Make sure to unfreeze any frozen VCS service groups in the cluster for the installer to successfully stop Storage Foundation Cluster File System.
To set up disk-based I/O fencing using the installsfcfs

1 Start the installsfcfs with `-fencing` option.

```
# /opt/VRTS/install/installsfcfs -fencing
```

The installsfcfs starts with a copyright message and verifies the cluster information.

Note the location of log files which you can access in the event of any problem with the configuration process.

2 Confirm that you want to proceed with the I/O fencing configuration at the prompt.

The program checks that the local node running the script can communicate with remote nodes and checks whether Storage Foundation Cluster File System 5.1 SP1 is configured properly.

3 Review the I/O fencing configuration options that the program presents. Type 2 to configure disk-based I/O fencing.

```
Select the fencing mechanism to be configured in this Application Cluster [1-3,b,q] 2
```

4 Review the output as the configuration program checks whether VxVM is already started and is running.

- If the check fails, configure and enable VxVM before you repeat this procedure.
- If the check passes, then the program prompts you for the coordinator disk group information.

5 Choose whether to use an existing disk group or create a new disk group to configure as the coordinator disk group.

The program lists the available disk group names and provides an option to create a new disk group. Perform one of the following:

- To use an existing disk group, enter the number corresponding to the disk group at the prompt.
  The program verifies whether the disk group you chose has an odd number of disks and that the disk group has a minimum of three disks.
- To create a new disk group, perform the following steps:
  - Enter the number corresponding to the Create a new disk group option.
    The program lists the available disks that are in the CDS disk format in the cluster and asks you to choose an odd number of disks with at least three disks to be used as coordinator disks.
Symantec recommends that you use three disks as coordination points for disk-based I/O fencing.

- Enter the numbers corresponding to the disks that you want to use as coordinator disks.
- Enter the disk group name.

6 Verify that the coordinator disks you chose meet the I/O fencing requirements. You must verify that the disks are SCSI-3 PR compatible using the vxfentsthdw utility and then return to this configuration program.

See “Checking shared disks for I/O fencing” on page 151.

7 After you confirm the requirements, the program creates the coordinator disk group with the information you provided. The program also does the following:

- Populates the /etc/vxfendg file with this disk group information
- Populates the /etc/vxfenmode file on each cluster node with the I/O fencing mode information and with the SCSI-3 disk policy information

8 Verify and confirm the I/O fencing configuration information that the installer summarizes.

9 Review the output as the configuration program does the following:

- Stops VCS and I/O fencing on each node.
- Configures disk-based I/O fencing and starts the I/O fencing process.
- Updates the VCS configuration file main.cf if necessary.
- Copies the /etc/vxfenmode file to a date and time suffixed file /etc/vxfenmode-date-time. This backup file is useful if any future fencing configuration fails.
- Starts VCS on each node to make sure that the Storage Foundation Cluster File System is cleanly configured to use the I/O fencing feature.

10 Review the output as the configuration program displays the location of the log files, the summary files, and the response files.

11 Configure the Coordination Point agent to monitor the coordinator disks.

See “Configuring Coordination Point agent to monitor coordination points” on page 177.
Checking shared disks for I/O fencing

Make sure that the shared storage you set up while preparing to configure SFCFS meets the I/O fencing requirements. You can test the shared disks using the vxfentsthdw utility. The two nodes must have ssh (default) or remsh communication. To confirm whether a disk (or LUN) supports SCSI-3 persistent reservations, two nodes must simultaneously have access to the same disks. Because a shared disk is likely to have a different name on each node, check the serial number to verify the identity of the disk. Use the vxfenadm command with the -i option. This command option verifies that the same serial number for the LUN is returned on all paths to the LUN.

Make sure to test the disks that serve as coordinator disks.

The vxfentsthdw utility has additional options suitable for testing many disks. Review the options for testing the disk groups (-g) and the disks that are listed in a file (-f). You can also test disks without destroying data using the -r option.

See the Veritas Storage Foundation Cluster File System Administrator's Guide.

Checking that disks support SCSI-3 involves the following tasks:

- Verifying the Array Support Library (ASL)
  See “Verifying Array Support Library (ASL)” on page 151.

- Verifying that nodes have access to the same disk
  See “Verifying that the nodes have access to the same disk” on page 152.

- Testing the shared disks for SCSI-3
  See “Testing the disks using vxfentsthdw utility” on page 153.

Verifying Array Support Library (ASL)

Make sure that the Array Support Library (ASL) for the array that you add is installed.
To verify Array Support Library (ASL)

1. If the Array Support Library (ASL) for the array that you add is not installed, obtain and install it on each node before proceeding.

   The ASL for the supported storage device that you add is available from the disk array vendor or Symantec technical support.

2. Verify that the ASL for the disk array is installed on each of the nodes. Run the following command on each node and examine the output to verify the installation of ASL.

   ```
   # vxddladm listsupport all
   ```

3. Scan all disk drives and their attributes, update the VxVM device list, and reconfigure DMP with the new devices. Type:

   ```
   # vxdisk scandisks
   ```

   See the Veritas Volume Manager documentation for details on how to add and configure disks.

Verifying that the nodes have access to the same disk

Before you test the disks that you plan to use as shared data storage or as coordinator disks using the vxfentsthdw utility, you must verify that the systems see the same disk.

To verify that the nodes have access to the same disk

1. Verify the connection of the shared storage for data to two of the nodes on which you installed SFCFS.

2. Ensure that both nodes are connected to the same disk during the testing. Use the vxfenadm command to verify the disk serial number.

   ```
   vxfenadm -i diskpath
   ```

   Refer to the `vxfenadm (1M)` manual page.

   For example, an EMC disk is accessible by the `/dev/rdsk/c1t1d0` path on node A and the `/dev/rdsk/c2t1d0` path on node B.

   From node A, enter:

   ```
   vxfenadm -i /dev/rdsk/c1t1d0
   ```

   Vendor id : EMC
   Product id : SYMMETRIX
Revision : 5567
Serial Number : 42031000a

The same serial number information should appear when you enter the equivalent command on node B using the /dev/rdsk/c2t1d0 path.

On a disk from another manufacturer, Hitachi Data Systems, the output is different and may resemble:

```
# vxfenadm -i /dev/rdsk/c3t1d2
Vendor id : HITACHI
Product id : OPEN-3 -HP
Revision : 0117
Serial Number : 0401EB6F0002
```

Testing the disks using vxfentsthdw utility

This procedure uses the /dev/rdsk/c1t1d0 disk in the steps.

If the utility does not show a message that states a disk is ready, the verification has failed. Failure of verification can be the result of an improperly configured disk array. The failure can also be due to a bad disk.

If the failure is due to a bad disk, remove and replace it. The vxfentsthdw utility indicates a disk can be used for I/O fencing with a message resembling:

```
The disk /dev/rdsk/c1t1d0 is ready to be configured for I/O Fencing on node galaxy
```

To test the disks using vxfentsthdw utility

1. Make sure system-to-system communication functions properly.

2. From one node, start the utility.
   Run the utility with the -n option if you use `remsh` for communication.

```
# vxfentsthdw [-n]
```
The script warns that the tests overwrite data on the disks. After you review the overview and the warning, confirm to continue the process and enter the node names.

**Warning:** The tests overwrite and destroy data on the disks unless you use the `-r` option.

******** WARNING!!!!!!! ********
THIS UTILITY WILL DESTROY THE DATA ON THE DISK!!

Do you still want to continue: [y/n] (default: n) **y**
Enter the first node of the cluster: galaxy
Enter the second node of the cluster: nebula

4 Enter the names of the disks that you want to check. Each node may know the same disk by a different name.

If the serial numbers of the disks are not identical, then the test terminates.

5 Review the output as the utility performs the checks and report its activities.

6 If a disk is ready for I/O fencing on each node, the utility reports success for each node. For example, the utility displays the following message for the node galaxy.

The disk is now ready to be configured for I/O Fencing on node galaxy

ALL tests on the disk /dev/rdsk/c1t1d0 have PASSED
The disk is now ready to be configured for I/O Fencing on node galaxy

7 Run the vxfentsthdw utility for each disk you intend to verify.

**Setting up disk-based I/O fencing manually**

Table 9-1 lists the tasks that are involved in setting up I/O fencing.

### Identifying disks to use as coordinator disks

Make sure you initialized disks as VxVM disks.

See “Initializing disks as VxVM disks” on page 147.

Review the following procedure to identify disks to use as coordinator disks.

**To identify the coordinator disks**

1. List the disks on each node.  
   For example, execute the following commands to list the disks:
   ```bash
   # vxdisk -o alldgs list
   ```

2. Pick three SCSI-3 PR compliant shared disks as coordinator disks.  
   See “Checking shared disks for I/O fencing” on page 151.
Setting up coordinator disk groups

From one node, create a disk group named vxfencoorddg. This group must contain three disks or LUNs. You must also set the coordinator attribute for the coordinator disk group. VxVM uses this attribute to prevent the reassignment of coordinator disks to other disk groups.

Note that if you create a coordinator disk group as a regular disk group, you can turn on the coordinator attribute in Volume Manager.

Refer to the Veritas Volume Manager Administrator’s Guide for details on how to create disk groups.

The following example procedure assumes that the disks have the device names c1t1d0, c2t1d0, and c3t1d0.

**To create the vxfencoorddg disk group**

1. On any node, create the disk group by specifying the device names:

   ```
   # vxdg init vxfencoorddg c1t1d0 c2t1d0 c3t1d0
   ```

2. Set the coordinator attribute value as "on" for the coordinator disk group:

   ```
   # vxdg -g vxfencoorddg set coordinator=on
   ```

3. Deport the coordinator disk group:

   ```
   # vxdg deport vxfencoorddg
   ```

4. Import the disk group with the \(-t\) option to avoid automatically importing it when the nodes restart:

   ```
   # vxdg -t import vxfencoorddg
   ```

5. Deport the disk group. Deporting the disk group prevents the coordinator disks from serving other purposes:

   ```
   # vxdg deport vxfencoorddg
   ```

Creating I/O fencing configuration files

After you set up the coordinator disk group, you must do the following to configure I/O fencing:

- Create the I/O fencing configuration file /etc/vxfendg
- Update the I/O fencing configuration file /etc/vxfenmode
To update the I/O fencing files and start I/O fencing

1. On each node, type:

   ```
   # echo "vxfencoorddg" > /etc/vxfendg
   ```

   Do not use spaces between the quotes in the "vxfencoorddg" text.
   This command creates the /etc/vxfendg file, which includes the name of the coordinator disk group.

2. Update the /etc/vxfenmode file to specify to use the SCSI-3 dmp disk policy. On all cluster nodes, type:

   ```
   # cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
   ```

3. To check the updated /etc/vxfenmode configuration, enter the following command on one of the nodes. For example:

   ```
   # more /etc/vxfenmode
   ```

4. Edit the following file on each node in the cluster to change the values of the VXFEN_START and the VXFEN_STOP environment variables to 1:

   ```
   /etc/rc.config.d/vxfenconf
   ```

Modifying VCS configuration to use I/O fencing

After you add coordination points and configure I/O fencing, add the UseFence = SCSI3 cluster attribute to the VCS configuration file /etc/VRTSvcs/conf/config/main.cf. If you reset this attribute to UseFence = None, VCS does not make use of I/O fencing abilities while failing over service groups. However, I/O fencing needs to be disabled separately.

To modify VCS configuration to enable I/O fencing

1. Save the existing configuration:

   ```
   # haconf -dump -makero
   ```

2. Stop VCS on all nodes:

   ```
   # hastop -all
   ```

3. If the I/O fencing driver vxfen is already running, stop the I/O fencing driver.

   ```
   # /sbin/init.d/vxfen stop
   ```
4 Make a backup copy of the main.cf file:

```
# cd /etc/VRTSvcs/conf/config
# cp main.cf main.orig
```

5 On one node, use vi or another text editor to edit the main.cf file. To modify the list of cluster attributes, add the UseFence attribute and assign its value as SCSI3.

```
cluster clus1(
  UserNames = { admin = "cDRpdxPmHpzS." }
  Administrators = { admin }
  HacliUserLevel = COMMANDROOT
  CounterInterval = 5
  UseFence = SCSI3
)
```

Regardless of whether the fencing configuration is disk-based or server-based, the value of the cluster-level attribute UseFence is set to SCSI3.

6 Save and close the file.

7 Verify the syntax of the file /etc/VRTSvcs/conf/config/main.cf:

```
# hacf -verify /etc/VRTSvcs/conf/config
```

8 Using rcp or another utility, copy the VCS configuration file from a node (for example, galaxy) to the remaining cluster nodes.

For example, on each remaining node, enter:

```
# rcp galaxy:/etc/VRTSvcs/conf/config/main.cf \
/etc/VRTSvcs/conf/config
```

9 Start the I/O fencing driver and VCS. Perform the following steps on each node:

- Start the I/O fencing driver.
  The vxfen startup script also invokes the vxfenconfig command, which configures the vxfen driver to start and use the coordination points that are listed in /etc/vxfentab.

  ```
  # /sbin/init.d/vxfen start
  ```

- Start VCS.

  ```
  # /opt/VRTS/bin/hastart
  ```
Verifying I/O fencing configuration

Verify from the vxfenadm output that the SCSI-3 disk policy reflects the configuration in the /etc/vxfenmode file.

To verify I/O fencing configuration

1. On one of the nodes, type:

   ```
   # vxfenadm -d
   ```

   Output similar to the following appears if the SCSI3 disk policy is dmp:

   ```
   I/O Fencing Cluster Information:
   ===============================
   Fencing Protocol Version: 201
   Fencing Mode: SCSI3
   Fencing SCSI3 Disk Policy: dmp
   Cluster Members:
   * 0 (galaxy)
   1 (nebula)
   RFSM State Information:
   node 0 in state 8 (running)
   node 1 in state 8 (running)
   ```

2. Verify that the disk-based I/O fencing is using the specified disks.

   ```
   # vxfenconfig -l
   ```

Setting up server-based I/O fencing using installsfcfs

If Storage Foundation Cluster File System cluster is configured to run in secure mode, then verify that the configuration is correct before you configure CP server-based I/O fencing.

See “Configuring server-based I/O fencing using the installsfcfs” on page 159.

Configuring server-based I/O fencing using the installsfcfs

You can configure server-based I/O fencing for the Storage Foundation Cluster File System cluster using the installsfcfs.
With server-based fencing, you can have the coordination points in your configuration as follows:

- Combination of CP servers and SCSI-3 compliant coordinator disks
- CP servers only
  Symantec also supports server-based fencing with a single highly available CP server that acts as a single coordination point.

See “About planning to configure I/O fencing” on page 88.

See “Recommended CP server configurations” on page 93.

This section covers the following example procedures:

<table>
<thead>
<tr>
<th>Mix of CP servers and coordinator disks</th>
<th>See “To configure server-based fencing for the Storage Foundation Cluster File System cluster (one CP server and two coordinator disks)” on page 160.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single CP server</td>
<td>See “To configure server-based fencing for the Storage Foundation Cluster File System cluster (single CP server)” on page 165.</td>
</tr>
</tbody>
</table>

**To configure server-based fencing for the Storage Foundation Cluster File System cluster (one CP server and two coordinator disks)**

1. Depending on the server-based configuration model in your setup, make sure of the following:

   - CP servers are configured and are reachable from the Storage Foundation Cluster File System cluster. The Storage Foundation Cluster File System cluster is also referred to as the application cluster or the client cluster. See “Setting up the CP server” on page 96.

   - The coordination disks are verified for SCSI3-PR compliance. See “Checking shared disks for I/O fencing” on page 151.

2. Start the installsfcfs with `-fencing` option.

   ```
   # /opt/VRTS/install/installsfdfs -fencing
   ```

   The installsfcfs starts with a copyright message and verifies the cluster information.

   Note the location of log files which you can access in the event of any problem with the configuration process.
3 Confirm that you want to proceed with the I/O fencing configuration at the prompt.

The program checks that the local node running the script can communicate with remote nodes and checks whether Storage Foundation Cluster File System 5.1 SP1 is configured properly.

4 Review the I/O fencing configuration options that the program presents. Type 1 to configure server-based I/O fencing.

Select the fencing mechanism to be configured in this Application Cluster [1-3,b,q] 1

5 Make sure that the storage supports SCSI3-PR, and answer y at the following prompt.

Does your storage environment support SCSI3 PR? [y,n,q] (y)

6 Provide the following details about the coordination points at the installer prompt:

- Enter the total number of coordination points including both servers and disks. This number should be at least 3.

Enter the total number of co-ordination points including both CP servers and disks: [b] (3)

- Enter the total number of coordinator disks among the coordination points.

Enter the total number of disks among these:
[b] (0) 2

7 Provide the following CP server details at the installer prompt:

- Enter the virtual IP addresses or host names of the virtual IP address for each of the CP servers. The installer assumes these values to be identical as viewed from all the application cluster nodes.

Enter the Virtual IP address/fully qualified host name for the Co-ordination Point Server #1:
[b] 10.209.80.197

- Enter the port that the CP server would be listening on.

Enter the port in the range [49152, 65535] which the Co-ordination Point Server 10.209.80.197
would be listening on or simply accept the default port suggested: [b] (14250)

8 Provide the following coordinator disks-related details at the installer prompt:

- Enter the I/O fencing disk policy for the coordinator disks.

  Enter fencing mechanism for the disk(s) (raw/dmp):
  [b,q,?] raw

- Choose the coordinator disks from the list of available disks that the installer displays. Ensure that the disk you choose is available from all the Storage Foundation Cluster File System (application cluster) nodes. The number of times that the installer asks you to choose the disks depends on the information that you provided in step 6. For example, if you had chosen to configure two coordinator disks, the installer asks you to choose the first disk and then the second disk:

  Select disk number 1 for co-ordination point

  1) c1t1d0
  2) c2t1d0
  3) c3t1d0

  Please enter a valid disk which is available from all the cluster nodes for co-ordination point [1-3,q] 1

- If you have not already checked the disks for SCSI-3 PR compliance in step 1, check the disks now.
  The installer displays a message that recommends you to verify the disks in another window and then return to this configuration procedure.
  Press Enter to continue, and confirm your disk selection at the installer prompt.

- Enter a disk group name for the coordinator disks or accept the default.

  Enter the disk group name for coordinating disk(s):
  [b] (vxfencoorddg)
9 Verify and confirm the coordination points information for the fencing configuration.

For example:

Total number of coordination points being used: 3
CP Server (Port):
  1. 10.209.80.197 (14250)
SCSI-3 disks:
  1. c1t1d0
  2. c2t1d0
Disk Group name for the disks in customized fencing: vxfencoorddg
Disk mechanism used for customized fencing: raw

The installer initializes the disks and the disk group and deports the disk group on the Storage Foundation Cluster File System (application cluster) node.

10 If the CP server is configured for security, the installer sets up secure communication between the CP server and the Storage Foundation Cluster File System (application cluster):

- Make sure that the security configuration in the application cluster and the CP server is the same. If CP server is configured for security, ensure that the application cluster also runs in secure mode.

- If the CP server is configured for security, perform the following steps:
  - Review the output as the installer verifies if the Storage Foundation Cluster File System (application cluster) nodes have already established trust with an AT root broker.
  - If the Storage Foundation Cluster File System (application cluster) nodes and the CP server use different AT root brokers, enter y at the installer prompt and provide the following information:
    - Hostname for the authentication broker for any one of the CP servers
    - Port number where the authentication broker for the CP server is listening for establishing trust
    - Hostname for the authentication broker for any one of the Storage Foundation Cluster File System (application cluster) nodes
    - Port number where the authentication broker for the Storage Foundation Cluster File System (application cluster) is listening for establishing trust
After the installer establishes trust between the authentication brokers of the CP servers and the application cluster nodes, press Enter to continue.

11 Verify and confirm the I/O fencing configuration information.

   CPS Admin utility location: /opt/VRTScps/bin/cpsadm
   Cluster ID: 2122
   Cluster Name: clus1
   UUID for the above cluster: {ae5e589a-1dd1-11b2-dd44-00144f79240c}

12 Review the output as the installer updates the application cluster information on each of the CP servers to ensure connectivity between them. The installer then populates the /etc/vxfenmode file with the appropriate details in each of the application cluster nodes.

   Updating client cluster information on CP Server 10.210.80.199
   Adding the client cluster to the CP Server 10.210.80.199 ................. Done
   Registering client node galaxy with CP Server 10.210.80.199 ............ Done
   Adding CPClient user for communicating to CP Server 10.210.80.199 ....... Done
   Adding cluster clus1 to the CPClient user on CP Server 10.210.80.199 ... Done
   Registering client node nebula with CP Server 10.210.80.199 ............ Done
   Adding CPClient user for communicating to CP Server 10.210.80.199 ....... Done
   Adding cluster clus1 to the CPClient user on CP Server 10.210.80.199 ... Done
   Updating /etc/vxfenmode file on galaxy .................................. Done
   Updating /etc/vxfenmode file on nebula ................................. Done

   See “About I/O fencing configuration files” on page 86.

13 Configure the CP agent on the Storage Foundation Cluster File System (application cluster).

   Do you want to configure CP Agent on the client cluster? [y,n,q] (y)

   Enter a non-existing name for the service group for CP Agent: [b] (vxfen)

   Adding CP Agent via galaxy .............................. Done
14 Review the output as the installer stops and restarts the VCS and the fencing processes on each application cluster node, and completes the I/O fencing configuration.

15 Note the location of the configuration log files, summary files, and response files that the installer displays for later use.

To configure server-based fencing for the Storage Foundation Cluster File System cluster (single CP server)

1 Make sure that the CP server is configured and is reachable from the Storage Foundation Cluster File System cluster. The Storage Foundation Cluster File System cluster is also referred to as the application cluster or the client cluster.

See “Setting up the CP server” on page 96.

2 Start the installsfcfs with -fencing option.

```
# /opt/VRTS/install/installsfcfs -fencing
```

The installsfcfs starts with a copyright message and verifies the cluster information.

Note the location of log files which you can access in the event of any problem with the configuration process.

3 Confirm that you want to proceed with the I/O fencing configuration at the prompt.

The program checks that the local node running the script can communicate with remote nodes and checks whether Storage Foundation Cluster File System 5.1 SP1 is configured properly.

4 Review the I/O fencing configuration options that the program presents. Type 1 to configure server-based I/O fencing.

```
Select the fencing mechanism to be configured in this Application Cluster [1-3,b,q] 1
```

5 Make sure that the storage supports SCSI3-PR, and answer y at the following prompt.

```
Does your storage environment support SCSI3 PR? [y,n,q] (y)
```
6 Enter the total number of coordination points as 1.

Enter the total number of co-ordination points including both CP servers and disks: [b] (3) 1

Read the installer warning carefully before you proceed with the configuration.

7 Provide the following CP server details at the installer prompt:

- Enter the virtual IP address or the host name of the virtual IP address for the CP server. The installer assumes these values to be identical as viewed from all the application cluster nodes.

Enter the Virtual IP address/fully qualified host name for the Co-ordination Point Server #1:
[b] 10.209.80.197

- Enter the port that the CP server would be listening on.

Enter the port in the range [49152, 65535] which the Co-ordination Point Server 10.209.80.197 would be listening on or simply accept the default port suggested:
[b] (14250)

8 Verify and confirm the coordination points information for the fencing configuration.

For example:

Total number of coordination points being used: 1
CP Server (Port):
  1. 10.209.80.197 (14250)

9 If the CP server is configured for security, the installer sets up secure communication between the CP server and the Storage Foundation Cluster File System (application cluster):

- Make sure that the security configuration in the application cluster and the CP server is the same. If CP server is configured for security, ensure that the application cluster also runs in secure mode.

- If the CP server is configured for security, perform the following steps:

  - Review the output as the installer verifies if the Storage Foundation Cluster File System (application cluster) nodes have already established trust with an AT root broker.
If the Storage Foundation Cluster File System (application cluster) nodes and the CP server use different AT root brokers, enter y at the installer prompt and provide the following information:

- Hostname for the authentication broker for any one of the CP servers
- Port number where the authentication broker for the CP server is listening for establishing trust
- Hostname for the authentication broker for any one of the Storage Foundation Cluster File System (application cluster) nodes
- Port number where the authentication broker for the Storage Foundation Cluster File System (application cluster) is listening for establishing trust

After the installer establishes trust between the authentication brokers of the CP servers and the application cluster nodes, press Enter to continue.

10 Verify and confirm the I/O fencing configuration information.

CPS Admin utility location: /opt/VRTScps/bin/cpsadm
Cluster ID: 2122
Cluster Name: clus1
UUID for the above cluster: {ae5e589a-1dd1-11b2-dd44-00144f79240c}
11 Review the output as the installer updates the application cluster information on each of the CP servers to ensure connectivity between them. The installer then populates the /etc/vxfenmode file with the appropriate details in each of the application cluster nodes.

The installer also populates the /etc/vxfenmode file with the entry single_cp=1 for such single CP server fencing configuration.

Updating client cluster information on CP Server 10.210.80.199

Adding the client cluster to the CP Server 10.210.80.199 .................. Done

Registering client node galaxy with CP Server 10.210.80.199............... Done
Adding CPClient user for communicating to CP Server 10.210.80.199 ....... Done
Adding cluster clus1 to the CPClient user on CP Server 10.210.80.199 ... Done

Registering client node nebula with CP Server 10.210.80.199 ............ Done
Adding CPClient user for communicating to CP Server 10.210.80.199 ....... Done
Adding cluster clus1 to the CPClient user on CP Server 10.210.80.199 ... Done

Updating /etc/vxfenmode file on galaxy .................................. Done
Updating /etc/vxfenmode file on nebula ................................. Done

See “About I/O fencing configuration files” on page 86.

12 Configure the CP agent on the Storage Foundation Cluster File System (application cluster).

Do you want to configure CP Agent on the client cluster? [y,n,q] (y)

Enter a non-existing name for the service group for CP Agent: [b] (vxfen)

Adding CP Agent via galaxy ........................................... Done

13 Review the output as the installer stops and restarts VCS with the fencing processes on each application cluster node, and completes the I/O fencing configuration.

14 Note the location of the configuration log files, summary files, and response files that the installer displays for later use.
Setting up non-SCSI3 server-based I/O fencing using `installsfcfs`

If Storage Foundation Cluster File System cluster is configured to run in secure mode, then verify that the configuration is correct before you configure non-SCSI3 server-based I/O fencing.

### Setting up server-based I/O fencing manually

Tasks that are involved in setting up server-based I/O fencing manually include:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Preparing the CP servers for use by the Storage Foundation Cluster File System cluster</td>
<td>See “Preparing the CP servers manually for use by the SFCFS cluster” on page 169.</td>
</tr>
<tr>
<td>Modifying I/O fencing configuration files to configure server-based I/O fencing</td>
<td>See “Configuring server-based fencing on the SFCFS cluster manually” on page 173.</td>
</tr>
<tr>
<td>Modifying Storage Foundation Cluster File System configuration to use I/O fencing</td>
<td>See “Modifying VCS configuration to use I/O fencing” on page 157.</td>
</tr>
<tr>
<td>Configuring Coordination Point agent to monitor coordination points</td>
<td>See “Configuring Coordination Point agent to monitor coordination points” on page 177.</td>
</tr>
<tr>
<td>Verifying the server-based I/O fencing configuration</td>
<td>See “Verifying server-based I/O fencing configuration” on page 179.</td>
</tr>
</tbody>
</table>

Preparing the CP servers manually for use by the SFCFS cluster

Use this procedure to manually prepare the CP server for use by the SFCFS cluster or clusters.

*Table 9-3* displays the sample values used in this procedure.
To manually configure CP servers for use by the SFCFS cluster

1. Determine the cluster name and uuid on the SFCFS cluster.
   For example, issue the following commands on one of the SFCFS cluster nodes (galaxy):

   ```
   # grep cluster /etc/VRTSvcs/conf/config/main.cf
   cluster clus1
   # cat /etc/vx/.uuids/clusuuid
   {f0735332-1dd1-11b2}
   ```

2. Use the `cpsadm` command to check whether the SFCFS cluster and nodes are present in the CP server.
   For example:

   ```
   # cpsadm -s mycps1.symantecexample.com -a list_nodes
   ClusName   UUID       Hostname(Node ID) Registered
   clus1      {f0735332-1dd1-11b2} galaxy(0) 0
   clus1      {f0735332-1dd1-11b2} nebula(1) 0
   ```

   If the output does not show the cluster and nodes, then add them as described in the next step.

   For detailed information about the `cpsadm` command, see the *Veritas Storage Foundation Cluster File System Administrator’s Guide*. 

---

**Table 9-3** Sample values in procedure

<table>
<thead>
<tr>
<th>CP server configuration component</th>
<th>Sample name</th>
</tr>
</thead>
<tbody>
<tr>
<td>CP server</td>
<td>mycps1.symantecexample.com</td>
</tr>
<tr>
<td>Node #1 - SFCFS cluster</td>
<td>galaxy</td>
</tr>
<tr>
<td>Node #2 - SFCFS cluster</td>
<td>nebula</td>
</tr>
<tr>
<td>Cluster name</td>
<td>clus1</td>
</tr>
<tr>
<td>Cluster UUID</td>
<td>{f0735332-1dd1-11b2}</td>
</tr>
</tbody>
</table>
3 Add the SFCFS cluster and nodes to each CP server.

For example, issue the following command on the CP server (mycps1.symantecexample.com) to add the cluster:

```bash
# cpsadm -s mycps1.symantecexample.com -a add_clus\n  -c clus1 -u {f0735332-1dd1-11b2}
```

Cluster clus1 added successfully

Issue the following command on the CP server (mycps1.symantecexample.com) to add the first node:

```bash
# cpsadm -s mycps1.symantecexample.com -a add_node\n  -c clus1 -u {f0735332-1dd1-11b2} -h galaxy -n0
```

Node 0 (galaxy) successfully added

Issue the following command on the CP server (mycps1.symantecexample.com) to add the second node:

```bash
# cpsadm -s mycps1.symantecexample.com -a add_node\n  -c clus1 -u {f0735332-1dd1-11b2} -h nebula -n1
```

Node 1 (nebula) successfully added

4 If security is to be enabled, check whether the _HA_VCS_ users are created in the CP server.

If the output below does not show the users, then add them as described in the next step.

```bash
# cpsadm -s mycps1.symantecexample.com -a list_users
```

<table>
<thead>
<tr>
<th>Username/Domain</th>
<th>Cluster Name / UUID</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>_HA_VCS_galaxy@<a href="mailto:HA_SERVICES@galaxy.symantecexample.com">HA_SERVICES@galaxy.symantecexample.com</a>/vx clus1/{f0735332-1dd1-11b2}</td>
<td>Operator</td>
<td></td>
</tr>
<tr>
<td>_HA_VCS_nebula@<a href="mailto:HA_SERVICES@nebula.symantecexample.com">HA_SERVICES@nebula.symantecexample.com</a>/vx clus1/{f0735332-1dd1-11b2}</td>
<td>Operator</td>
<td></td>
</tr>
</tbody>
</table>

If security is to be disabled, then add the user name "cpsclient@hostname" to the server instead of the _HA_VCS_ users (for example, cpsclient@galaxy).

The CP server can only run in either secure mode or non-secure mode, both connections are not accepted at the same time.
Add the users to the CP server.

First, determine the user@domain to be added on the SFCFS cluster (application cluster).

The user for fencing should be of the form _HA_VCS_short-hostname and domain name is that of HA_SERVICES user in the output of command:

```
# /opt/VRTScps/bin/cpsat listpd -t local
```

Next, issue the following commands on the CP server (mycps1.symantecexample.com):

```
# cpsadm -s mycps1.symantecexample.com -a add_user -e \ 
  _HA_VCS_galaxy@HA_SERVICES@galaxy.symantecexample.com\ 
  -f cps_operator -g vx
```

User _HA_VCS_galaxy@HA_SERVICES@galaxy.symantecexample.com successfully added

```
# cpsadm -s mycps1.symantecexample.com -a add_user -e \ 
  _HA_VCS_nebula@HA_SERVICES@nebula.symantecexample.com\ 
  -f cps_operator -g vx
```

User _HA_VCS_nebula@HA_SERVICES@nebula.symantecexample.com successfully added
Authorize the CP server user to administer the SFCFS cluster. You must perform this task for the CP server users corresponding to each node in the SFCFS cluster.

For example, issue the following command on the CP server (mycps1.symantecexample.com) for SFCFS cluster clus1 with two nodes galaxy and nebula:

```
# cpsadm -s mycps1.symantecexample.com -a
  addclus_to_user -c clus1
  -u {f0735332-1d1-11b2}
  -e _HA_VCS_galaxy@HA_SERVICES@galaxy.symantecexample.com
  -f cps_operator -g vx
```

Cluster successfully added to user _HA_VCS_galaxy@HA_SERVICES@galaxy.symantecexample.com privileges.

```
# cpsadm -s mycps1.symantecexample.com -a
  addclus_to_user -c clus1
  -u {f0735332-1d1-11b2}
  -e _HA_VCS_nebula@HA_SERVICES@nebula.symantecexample.com
  -f cps_operator -g vx
```

Cluster successfully added to user _HA_VCS_nebula@HA_SERVICES@nebula.symantecexample.com privileges.

Configuring server-based fencing on the SFCFS cluster manually

The configuration process for the client or SFCFS cluster to use CP server as a coordination point requires editing the /etc/vxenmode file.

You need to edit this file to specify the following information for your configuration:

- Fencing mode
- Fencing mechanism
- Fencing disk policy (if applicable to your I/O fencing configuration)
- Appropriate value for the security configuration
- CP server or CP servers
- Coordinator disk group (if applicable to your I/O fencing configuration)
Note: Whenever coordinator disks are used as coordination points in your I/O fencing configuration, you must create a disk group (vxfendg). You must specify this disk group in the /etc/vxfenmode file.

See “Setting up coordinator disk groups” on page 156.

The customized fencing framework also generates the /etc/vxfentab file which has security setting and the coordination points (all the CP servers and disks from disk group specified in /etc/vxfenmode file).

To configure server-based fencing on the SFCFS cluster manually

1. Use a text editor to edit the following file on each node in the cluster:

   /etc/rc.config.d/vxfenconf

   You must change the values of the VXFEN_START and the VXFEN_STOP environment variables to 1.

2. Use a text editor to edit the /etc/vxfenmode file values to meet your configuration specifications.

   If your server-based fencing configuration uses a single highly available CP server as its only coordination point, make sure to add the single_cp=1 entry in the /etc/vxfenmode file.

   The following sample file output displays what the /etc/vxfenmode file contains:

   See “Sample vxfenmode file output” on page 174.

3. After editing the /etc/vxfenmode file, run the vxfen init script to start fencing.

   For example:

   # /sbin/init.d/vxfen start

Sample vxfenmode file output

The following sample file output displays

#
# vxfen_mode determines in what mode VCS I/O Fencing should work.
#
# available options:
# scsi3 - use scsi3 persistent reservation disks
# customized - use script based customized fencing
# disabled - run the driver but don't do any actual fencing
#

vxfen_mode=customized

# vxfen_mechanism determines the mechanism for customized I/O
# fencing that should be used.
#
# available options:
# cps       - use a coordination point server with optional script
#             controlled scsi3 disks
#
vxfen_mechanism=cps

#
# scsi3_disk_policy determines the way in which I/O Fencing
# communicates with the coordination disks. This field is
# required only if customized coordinator disks are being used.
#
# available options:
# dmp       - use dynamic multipathing
# raw       - connect to disks using the native interface
#
scsi3_disk_policy=dmp

# security when enabled uses secure communication to the cp server
# using VxAT (Veritas Authentication Service)
# available options:
# 0         - don't use Veritas Authentication Service for cp server
#              communication
# 1         - use Veritas Authentication Service for cp server
#              communication
security=1

#
# Specify 3 or more odd number of coordination points in this file,
# one in each row. They can be all-CP servers, all-SCSI-3 compliant
# coordinator disks, or a combination of CP servers and SCSI-3
# compliant coordinator disks. Please ensure that the CP server
# coordination points are numbered sequentially and in the same
# order on all the cluster nodes.
#
# Coordination Point Server(CPS) is specified as:
#
# cps<number>=<Virtual IP/ Virtual hostname of cp server> in
# square brackets ([]), followed by ":" and CPS port number.
# Examples:
# cps1=[192.168.0.23]:14250
# cps2=[mycps.company.com]:14250
#
# SCSI-3 compliant coordinator disks are specified as:
#
# vxfendg=<coordinator disk group name>
# Example:
# vxfendg=vxfencoorddg
#
# Examples of different configurations:
# 1. All CP server coordination points
# cps1=
# cps2=
# cps3=
#
# 2. A combination of CP server and a disk group having two SCSI-3
# coordinator disks
# cps1=
# vxfendg=
# Note: The disk group specified in this case should have two disks
# 3. All SCSI-3 coordinator disks
# vxfendg=
# Note: The disk group specified in case should have three disks
#

Table 9-4 defines the vxfenmode parameters that must be edited.

Table 9-4  vxfenmode file parameters

<table>
<thead>
<tr>
<th>vxfenmode File Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vxfen_mode</td>
<td>Fencing mode of operation. This parameter must be set to “customized”.</td>
</tr>
<tr>
<td>vxfen_mechanism</td>
<td>Fencing mechanism. This parameter defines the mechanism that is used for fencing. If one of the three coordination points is a CP server, then this parameter must be set to “cps”.</td>
</tr>
</tbody>
</table>
| scsi3_disk_policy | Configure the vxfen module to use either DMP devices, "dmp" or the underlying raw character devices, "raw".  
**Note:** The configured disk policy is applied on all the nodes. |
Table 9-4 vxfenmode file parameters (continued)

<table>
<thead>
<tr>
<th>vxfenmode File Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>security</td>
<td>Security parameter 1 indicates that Symantec Product Authentication Service is used for CP server communications. Security parameter 0 indicates that communication with the CP server is made in non-secure mode. The default security value is 1. <strong>Note:</strong> Symantec only supports a configuration where both the CP server and client sides have the same security setting. The security setting on both sides must be either enabled or disabled.</td>
</tr>
<tr>
<td>cps1, cps2, cps3, or vxfendg</td>
<td>Coordination point parameters. Enter either the Virtual IP address or FQHN (whichever is accessible) of the CP server. <strong>Note:</strong> Whenever coordinator disks are used in an I/O fencing configuration, a disk group has to be created (vxfendg) and specified in the /etc/vxfenmode file. Additionally, the customized fencing framework also generates the /etc/vxfentab file which specifies the security setting and the coordination points (all the CP servers and the disks from disk group specified in /etc/vxfenmode file).</td>
</tr>
<tr>
<td>single_cp</td>
<td>Value 1 for single_cp parameter indicates that the server-based fencing uses a single highly available CP server as its only coordination point. Value 0 for single_cp parameter indicates that the server-based fencing uses at least three coordination points.</td>
</tr>
</tbody>
</table>

### Configuring Coordination Point agent to monitor coordination points

The following procedure describes how to manually configure the Coordination Point agent to monitor coordination points (CP server or SCSI-3 disks).
To configure Configuration Point agent to monitor coordination points

1. Ensure that your SFCFS cluster has been properly installed and configured with fencing enabled.

2. Create a parallel service group vxfen and add a coordpoint resource to the vxfen service group using the following commands:

```bash
# haconf -makerw
# hagrp -add vxfen
# hagrp -modify vxfen SystemList galaxy 0 nebula 1
# hagrp -modify vxfen AutoFailOver 0
# hagrp -modify vxfen Parallel 1
# hagrp -modify vxfen SourceFile "./main.cf"
# hares -add coordpoint CoordPoint vxfen
# hares -modify coordpoint FaultTolerance 1
# hares -modify coordpoint Enabled 1
# haconf -dump -makero
```
Verify the status of the agent on the SFCFS cluster using the `hares` commands. For example:

```
# hares -state coordpoint
```

The following is an example of the command and output:

```
# hares -state coordpoint
# Resource  Attribute  System  Value
coordpoint  State      galaxy  ONLINE
coordpoint  State      nebula  ONLINE
```

Access the engine log to view the agent log. The agent log is written to the engine log.

The agent log contains detailed Coordination Point agent monitoring information; including information about whether the Coordination Point agent is able to access all the coordination points, information to check on which coordination points the Coordination Point agent is reporting missing keys, etc.

To view all such information in the engine log, change the dbg level for that node using the following commands:

```
# haconf -makerw
# hatype -modify Coordpoint LogDbg 10
# haconf -dump -makero
```

The agent log can now be viewed at the following location:

```
/var/VRTSvcs/log/engine_A.log
```

See the *Veritas Cluster Server Bundled Agents Reference Guide* for more information on the agent.

### Verifying server-based I/O fencing configuration

Follow the procedure described below to verify your server-based I/O fencing configuration.
To verify the server-based I/O fencing configuration

1. Verify that the I/O fencing configuration was successful by running the `vxfenadm` command.
   For example, run the following command:
   
   ```
   # vxfenadm -d
   ```

   **Note:** For troubleshooting any server-based I/O fencing configuration issues, refer to the *Veritas Storage Foundation Cluster File System Administrator’s Guide*.

2. Verify that I/O fencing is using the specified coordination points by running the `vxfenconfig` command.
   For example, run the following command:
   
   ```
   # vxfenconfig -l
   ```
   
   If the output displays `single_cp=1`, it indicates that the application cluster uses a CP server as the single coordination point for server-based fencing.

Setting up non-SCSI3 fencing in virtual environments manually

To manually set up I/O fencing in a non-SCSI-3 PR compliant setup

1. Configure I/O fencing in customized mode with only CP servers as coordination points.
   See “Setting up server-based I/O fencing manually” on page 169.

2. Make sure that the Storage Foundation Cluster File System cluster is online and check that the fencing mode is customized.
   
   ```
   # vxfenadm -d
   ```

3. Make sure that the cluster attribute `UseFence` is set to SCSI3.
   
   ```
   # haclus -value UseFence
   ```

4. On each node, edit the `/etc/vxenviron` file as follows:
   
   ```
   data_disk_fencing=off
   ```
5 Enter the following command to change the \texttt{vxfen\_min\_delay} parameter value:

\begin{verbatim}
# /usr/sbin/kctune vxfen_vxfnd_tmt=25
\end{verbatim}

6 On each node, edit the \texttt{/etc/vxfenmode} file as follows:

\begin{verbatim}
loser\_exit\_delay=55
vxfen\_script\_timeout=25
\end{verbatim}

Refer to the sample \texttt{/etc/vxfenmode} file.

7 On each node, set the value of the LLT sendhbcap timer parameter value as follows:

- Run the following command:

  \begin{verbatim}
  lltconfig -T sendhbcap:3000
  \end{verbatim}

- Add the following line to the \texttt{/etc/llttab} file so that the changes remain persistent after any reboot:

  \begin{verbatim}
  set-timer senhbcap:3000
  \end{verbatim}

8 On any one node, edit the VCS configuration file as follows:

- Make the VCS configuration file writable:

  \begin{verbatim}
  # haconf -makerw
  \end{verbatim}

- For each resource of the type DiskGroup, set the value of the MonitorReservation attribute to 0 and the value of the Reservation attribute to NONE.

  \begin{verbatim}
  # hares -modify <dg_resource> MonitorReservation 0
  # hares -modify <dg_resource> Reservation "NONE"
  \end{verbatim}

- Run the following command to verify the value:

  \begin{verbatim}
  # hares -list Type=DiskGroup MonitorReservation!=0
  # hares -list Type=DiskGroup Reservation!="NONE"
  \end{verbatim}

  The command should not list any resources.

- Modify the default value of the Reservation attribute at type-level.

  \begin{verbatim}
  # haattr -default DiskGroup Reservation "NONE"
  \end{verbatim}
Make the VCS configuration file read-only

```
# haconf -dump -makero
```

9 Make sure that the UseFence attribute in the VCS configuration file main.cf is set to SCSI3.

10 To make these VxFEN changes take effect, stop and restart VxFEN and the dependent modules

- On each node, run the following command to stop VCS:

```
/sbin/init.d/vcs stop
```

- After VCS takes all services offline, run the following command to stop VxFEN:

```
/sbin/init.d/vxfen stop
```

- On each node, run the following commands to restart VxFEN and VCS:

```
# /sbin/init.d/vxfen start
# /sbin/init.d/vcs start
```

**Sample /etc/vxfenmode file for non-SCSI3 fencing**

```
# vxfen_mode determines in what mode VCS I/O Fencing should work.
# available options:
# scsi3 - use scsi3 persistent reservation disks
# customized - use script based customized fencing
# disabled - run the driver but don't do any actual fencing
# vxfen_mode=customized

# vxfen_mechanism determines the mechanism for customized I/O
# fencing that should be used.
# available options:
# cps - use a coordination point server with optional script
# controlled scsi3 disks
# vxfen_mechanism(cps
```
# scsi3_disk_policy determines the way in which I/O Fencing communicates with the coordination disks. This field is required only if customized coordinator disks are being used.
#
# available options:
# dmp - use dynamic multipathing
# raw - connect to disks using the native interface
#
# scsi3_disk_policy=dmp
#
# Seconds for which the winning sub cluster waits to allow for the losing subcluster to panic & drain I/Os. Useful in the absence of SCSI3 based data disk fencing
loser_exit_delay=55
#
# Seconds for which vxfend process wait for a customized fencing script to complete. Only used with vxfen_mode=customized
vxfen_script_timeout=25
#
# security when enabled uses secure communication to the cp server
# using VxAT (Veritas Authentication Service)
# available options:
# 0 - don't use Veritas Authentication Service for cp server
# 1 - use Veritas Authentication Service for cp server
# communication
security=1
#
# Specify 3 or more odd number of coordination points in this file, one in each row. They can be all-CP servers, all-SCSI-3 compliant coordinator disks, or a combination of CP servers and SCSI-3 compliant coordinator disks. Please ensure that the CP server coordination points are numbered sequentially and in the same order on all the cluster nodes.
#
# Coordination Point Server(CPS) is specified as:
#
# cps<number>=[Virtual IP/Virtual hostname of cp server] in square
Enabling or disabling the preferred fencing policy

You can enable or disable the preferred fencing feature for your I/O fencing configuration.

You can enable preferred fencing to use system-based race policy or group-based race policy. If you disable preferred fencing, the I/O fencing configuration uses the default count-based race policy.

See “About preferred fencing” on page 85.
To enable preferred fencing for the I/O fencing configuration

1. Make sure that the cluster is running with I/O fencing set up.
   
   # vxfenadm -d

2. Make sure that the cluster-level attribute UseFence has the value set to SCSI3.
   
   # haclus -value UseFence

3. To enable system-based race policy, perform the following steps:
   - Make the VCS configuration writable.
     
     # haconf -makerw
   - Set the value of the cluster-level attribute PreferredFencingPolicy as System.
     
     # haclus -modify PreferredFencingPolicy System
   - Set the value of the system-level attribute FencingWeight for each node in the cluster.
     For example, in a two-node cluster, where you want to assign galaxy five times more weight compared to nebula, run the following commands:
     
     # hasys -modify galaxy FencingWeight 50
     # hasys -modify nebula FencingWeight 10
   - Save the VCS configuration.
     
     # haconf -dump -makero

4. To enable group-based race policy, perform the following steps:
   - Make the VCS configuration writable.
     
     # haconf -makerw
   - Set the value of the cluster-level attribute PreferredFencingPolicy as Group.
     
     # haclus -modify PreferredFencingPolicy Group
   - Set the value of the group-level attribute Priority for each service group.
     For example, run the following command:
# hagrp -modify service_group Priority 1

Make sure that you assign a parent service group an equal or lower priority than its child service group. In case the parent and the child service groups are hosted in different subclusters, then the subcluster that hosts the child service group gets higher preference.

■ Save the VCS configuration.
   
   # haconf -dump -makero

5 To view the fencing node weights that are currently set in the fencing driver, run the following command:
   
   # vxfenconfig -a

To disable preferred fencing for the I/O fencing configuration

1 Make sure that the cluster is running with I/O fencing set up.
   
   # vxfenadm -d

2 Make sure that the cluster-level attribute UseFence has the value set to SCSI3.
   
   # haclus -value UseFence

3 To disable preferred fencing and use the default race policy, set the value of the cluster-level attribute PreferredFencingPolicy as Disabled.
   
   # haconf -makerw
   # haclus -modify PreferredFencingPolicy Disabled
   # haconf -dump -makero
Upgrading Storage Foundation Cluster File System

- Chapter 10. Preparing to upgrade Veritas Storage Foundation Cluster File System
- Chapter 11. Performing a typical SFCFS upgrade using the installer
- Chapter 12. Performing a phased upgrade
- Chapter 13. Upgrading the operating system
- Chapter 14. Upgrading Veritas Volume Replicator
- Chapter 15. Migrating from SFHA to SFCFS or SFCFSHA
- Chapter 16. Post-upgrade tasks
Preparing to upgrade
Veritas Storage Foundation
Cluster File System

This chapter includes the following topics:

- About upgrading
- About the different ways that you can upgrade
- Supported upgrade paths
- About using the installer to upgrade when the root disk is encapsulated
- Preparing to upgrade

About upgrading

You have many types of upgrades available. Before you start to upgrade, review the types of upgrades for the Veritas products.

See “About the different ways that you can upgrade” on page 190.

Review the supported upgrade paths that are available for the different methods of upgrading.

See “Supported upgrade paths” on page 190.

After you determine the type of upgrade that you want to perform and its upgrade paths, review the steps to prepare for the upgrade.
If you want to upgrade CP server systems that use VCS or SFHA to 5.1 SP1, make sure you upgraded all application clusters to 5.1 SP1. Then, upgrade VCS or SFHA on the CP server systems.

## About the different ways that you can upgrade

Symantec offers you several different ways to upgrade. You need to decide which upgrade method best suits your environment, your expertise, and the downtime required.

**Table 10-1  Available upgrade methods**

<table>
<thead>
<tr>
<th>Upgrade types and considerations</th>
<th>Methods available for upgrade</th>
</tr>
</thead>
<tbody>
<tr>
<td>Typical upgrades—uses a Veritas provided tool or you can perform the upgrade manually. Requires some server downtime.</td>
<td>Script-based—you can use this to upgrade for the supported upgrade paths</td>
</tr>
<tr>
<td></td>
<td>Web-based—you can use this to upgrade for the supported upgrade paths</td>
</tr>
<tr>
<td></td>
<td>Manual—you can use this to upgrade from the previous release</td>
</tr>
<tr>
<td></td>
<td>Response file—you can use this to upgrade from the previous release</td>
</tr>
</tbody>
</table>

| Phased upgrades—uses a Veritas provided tool and some manual steps. Requires less server downtime than a regular upgrade. | Script-based with some manual steps—you can use this to upgrade from the previous release |

**Note:** Script- and Web-based upgrades ask for very similar system information for upgrades.

## Supported upgrade paths

The following tables describe upgrading to 5.1 SP1.
<table>
<thead>
<tr>
<th>Veritas software versions</th>
<th>11.11</th>
<th>11.23</th>
<th>11.31</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.5 (SF/SFCFS)</td>
<td></td>
<td></td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>Upgrade OS to 11.23, upgrade OS to 11.31, then upgrade directly to 5.1SP1 using the installer script (SFCFS requires additional manual changes as mentioned in IG)</td>
<td>N/A</td>
<td>N/A</td>
</tr>
<tr>
<td>3.5 (VCS/DBEDs/VVR/SFRAC)</td>
<td></td>
<td></td>
<td>N/A</td>

</tr>
</tbody>
</table>
About using the installer to upgrade when the root disk is encapsulated

When you use the installer to upgrade from a previous version of SFCFS and the system where you plan to upgrade has an encapsulated root disk, you may have to unencapsulate it.

### Table 10-3  Upgrading using installer when the root disk is encapsulated

<table>
<thead>
<tr>
<th>Starting version</th>
<th>Ending version</th>
<th>Action required</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.x or 4.x MPx</td>
<td>5.1 SP1</td>
<td>Do not unencapsulate. The installer runs normally. Reboot after upgrade.</td>
</tr>
<tr>
<td>5.0 or 5.0 MPx or 5.0.1 or 5.0.1 RPx</td>
<td>5.1 SP1</td>
<td>Do not unencapsulate. The installer runs normally. Reboot after upgrade.</td>
</tr>
</tbody>
</table>

Preparing to upgrade

Before you upgrade, you need to prepare the systems and storage. Review the following procedures and perform the appropriate tasks.

Creating backups

Save relevant system information before the upgrade.

**To create backups**

1. Log in as superuser.
2. Before the upgrade, ensure that you have made backups of all data that you want to preserve.
3. Copy the `fstab` file to `fstab.orig`:

   ```bash
   # cp /etc/fstab /etc/fstab.orig
   ```
4 Run the `vxlicrep`, `vxdisk list`, and `vxprint -ht` commands and record the output. Use this information to reconfigure your system after the upgrade.

5 If you are installing the high availability version of the Veritas Storage Foundation 5.1 SP1 software, follow the guidelines given in the *Veritas Cluster Server Installation Guide* and *Veritas Cluster Server Release Notes* for information on preserving your VCS configuration across the installation procedure.

**Determining which 5.x release of Veritas File System and Veritas Volume Manager that you have installed**

If you are upgrading to this release and have a previously-installed release of Veritas File System (VxFS) and Veritas Volume Manager (VxVM), you must determine which release you have installed. Determining which 5.x release that you have installed can be difficult due to the binary path names being the same for both releases. Use the following procedures to determine which release you have installed.

**To determine which release of VxFS that you have installed**

- To determine which release of VxFS that you have installed, enter the following command:

```bash
# swlist -l product VRTSvxfs
```

If you have the 5.0 release installed, the command output includes the following information:

```
VRTSvxfs 5.0.31.0 VERITAS File System
```

If you have the 5.0.1 release installed, the command output includes the following information:

```
VRTSvxfs 5.0.31.5 VERITAS File System
```

If you have the 5.1 SP1 release installed, the command output includes the following information:

```
VRTSvxfs 5.1.100.000 VERITAS File System
```
To determine which release of VxVM that you have installed

- To determine which release of VxVM that you have installed, enter the following command:

```bash
swlist -l product VRTSvxvm
```

If you have the 5.0 release installed, the command output includes the following information:

```plaintext
VRTSvxvm 5.0.31.1 Veritas Volume Manager by Symantec
```

If you have the 5.0.1 release installed, the command output includes the following information:

```plaintext
VRTSvxvm 5.0.31.5 Veritas Volume Manager by Symantec
```

If you have the 5.1 SP1 release installed, the command output includes the following information:

```plaintext
VRTSvxvm 5.1.100.000 Veritas Volume Manager by Symantec
```

Preparing to upgrade the Veritas software

Ensure that you have made backups of all data that you want to preserve. In particular, you will need the information in files such as `/etc/fstab`. You should also run the `vxlicrep`, `vxdisk list`, and `vxprint -ht` commands, and record the output from these. You may need this information to reconfigure your system after the upgrade.

If you are upgrading an HA cluster, follow the guidelines given in the *Veritas Cluster Server (VCS) Installation Guide* for information on preserving your VCS configuration across the upgrade procedure. In particular, you should take care to make backups of configuration files, such as `main.cf` and `types.cf`, in the `/etcVRTSvcs/conf/config` directory. Additional configuration files, such as `OracleTypes.cf`, may also be present in this directory if you have installed any VCS agents. You should also back up these files.

**To prepare for the Veritas software upgrade**

1. Log in as superuser.
2. Perform any necessary preinstallation checks and configuration.

   See “About planning for SFCFS installation” on page 27.
3 If you are upgrading Veritas Storage Foundation for Oracle, resynchronize all existing snapshots before upgrading.

   # /opt/VRTS/bin/dbed_vmsnap -S $ORACLE_SID -f SNAPPLAN -o resync

4 Use the `vxlicrep` command to make a record of the currently installed Veritas licenses. Print the output or save it on a different system.

5 Stop activity to all VxVM volumes. For example, stop any applications such as databases that access the volumes.

6 If you are upgrading a high availability (HA) product, take all service groups offline.
   
   List all service groups:

   # /opt/VRTSvcs/bin/hagrp -list

   For each service group listed, take it offline:

   # /opt/VRTSvcs/bin/hagrp -offline service_group -sys system_name

7 Use the following command to check if any VxFS file systems or Storage Checkpoints are mounted:

   # df -F vxfs

8 Unmount all Storage Checkpoints and non-system VxFS file systems:

   # umount /checkpoint_name
   # umount /filesystem

9 Verify that all file systems have been cleanly unmounted:

   # echo "8192B.p S" | fsdb -F vxfs filesystem | grep clean
   flags 0 mod 0 clean clean_value

   A clean_value value of 0x5a indicates the file system is clean, 0x3c indicates the file system is dirty, and 0x69 indicates the file system is dusty. A dusty file system has pending extended operations.
10  (Optional) If a file system is not clean, enter the following commands for that file system:

```
# fsck -F vxfs filesystem
# mount -F vxfs filesystem mountpoint
# umount mountpoint
```

This should complete any extended operations that were outstanding on the file system and unmount the file system cleanly.

There may be a pending large fileset clone removal extended operation if the `umount` command fails with the following error:

```
file system device busy
```

An extended operation is pending if the following message is generated on the console:

```
Storage Checkpoint asynchronous operation on file_system file system still in progress.
```

11  (Optional) If an extended operation is pending, you must leave the file system mounted for a longer time to allow the operation to complete. Removing a very large fileset clone can take several hours.

12  (Optional) Repeat step 9 to verify that the unclean file system is now clean.

13  Stop all the volumes by entering the following command for each disk group:

```
# vxvol -g diskgroup stopall
```

To verify that no volumes remain open, use the following command:

```
# vxprint -Aht -e v_open
```

14  Comment out the non-system local VxFS mount points from the `/etc/fstab`. Make a record of the mount points for VxFS file systems and VxVM volumes that are defined in the `/etc/fstab` file. You will need to uncomment these entries in the `/etc/fstab` file on the upgraded system.

15  If Veritas Volume Replicator (VVR) is configured, do the following steps in the order shown:

- Verify that all of the Primary RLINKs are up to date:

  ```
  # vxrlink -g diskgroup status rlink_name
  ```

- Detach the RLINKs.
Disassociate the SRL.

Preupgrade planning for Veritas Volume Replicator

Before installing or upgrading Veritas Volume Replicator (VVR):

- Confirm that your system has enough free disk space to install VVR.
- Make sure you have root permissions. You must have root permissions to perform the install and upgrade procedures.

The following related documents are available:

- **Veritas Volume Replicator Planning and Tuning Guide**
  - Provides detailed explanation of VVR tunables

- **Veritas Volume Replicator Administrator’s Guide**
  - Describes how to change tunable values

See the *Getting Started Guide* for more information on the documentation.

Planning an upgrade from the previous VVR version

If you plan to upgrade VVR from the previous VVR version, you can upgrade VVR with reduced application downtime by upgrading the hosts at separate times. While the Primary is being upgraded, the application can be migrated to the Secondary, thus reducing downtime. The replication between the (upgraded) Primary and the Secondary, which have different versions of VVR, will still continue. This feature facilitates high availability even when the VVR upgrade is not complete on both the sites. Symantec recommends that the Secondary hosts be upgraded before the Primary host in the Replicated Data Set (RDS).

See the *Veritas Storage Foundation Release Notes* for information regarding VVR support for replicating across Storage Foundation versions.

Replicating between versions is intended to remove the restriction of upgrading the Primary and Secondary at the same time. VVR can continue to replicate an existing RDS with Replicated Volume Groups (RVGs) on the systems that you want to upgrade. When the Primary and Secondary are at different versions, VVR does not support changing the configuration with the `vradmin` command or creating a new RDS.

Also, if you specify TCP as the network protocol, the VVR versions on the Primary and Secondary determine whether the checksum is calculated. As shown in Table 10-4, if either the Primary or Secondary are running a version of VVR prior to 5.1 SP1, and you use the TCP protocol, VVR calculates the checksum for every data packet it replicates. If the Primary and Secondary are at VVR 5.1 SP1, VVR...
does not calculate the checksum. Instead, it relies on the TCP checksum mechanism.

Table 10-4 VVR versions and checksum calculations

<table>
<thead>
<tr>
<th>VVR prior to 5.1 SP1 (DG version &lt;= 140)</th>
<th>VVR 5.1 SP1 (DG version &gt;= 150)</th>
<th>VVR calculates checksum TCP connections?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Secondary</td>
<td>Yes</td>
</tr>
<tr>
<td>Secondary</td>
<td>Primary</td>
<td>Yes</td>
</tr>
<tr>
<td>Primary and Secondary</td>
<td></td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>Primary and Secondary</td>
<td>No</td>
</tr>
</tbody>
</table>

**Note:** When replicating between versions of VVR, avoid using commands associated with new features. The earlier version may not support new features and problems could occur.

If you do not need to upgrade all the hosts in the RDS simultaneously, you can use replication between versions after you upgrade one host. You can then upgrade the other hosts in the RDS later at your convenience.

**Note:** If you have a cluster setup, you must upgrade all the nodes in the cluster at the same time.

**Planning and upgrading VVR to use IPv6 as connection protocol**

Storage Foundation High Availability supports using IPv6 as the connection protocol.

This release supports the following configurations for VVR:

- VVR continues to support replication between IPv4-only nodes with IPv4 as the internet protocol
- VVR supports replication between IPv4-only nodes and IPv4/IPv6 dual-stack nodes with IPv4 as the internet protocol
- VVR supports replication between IPv6-only nodes and IPv4/IPv6 dual-stack nodes with IPv6 as the internet protocol
- VVR supports replication between IPv6 only nodes
- VVR supports replication to one or more IPv6 only nodes and one or more IPv4 only nodes from a IPv4/IPv6 dual-stack node
VVR supports replication of a shared disk group only when all the nodes in the cluster that share the disk group are at IPv4 or IPv6.

Preparing to upgrade VVR when VCS agents are configured

To prepare to upgrade VVR when VCS agents for VVR are configured, perform the following tasks in the order presented:

- Freezing the service groups and stopping all the applications
- Preparing for the upgrade when VCS agents are configured

Freezing the service groups and stopping all the applications

This section describes how to freeze the service groups and stop all applications.

To freeze the service groups and stop applications for the Primary and Secondary clusters

1. Log in as the superuser.
2. Make sure that \texttt{/opt/VRTS/bin} is in your \texttt{PATH} so that you can execute all the product commands.
3. Before the upgrade, cleanly shut down all applications.
   
   In a shared disk group environment:
   
   - OFFLINE all application service groups that do not contain RVGShared resources. Do not OFFLINE the ClusterService, cvm and RVGLogowner groups.
   - If the application resources are part of the same service group as an RVGShared resource, then OFFLINE only the application resources.

   In a private disk group environment:
   
   - OFFLINE all application service groups that do not contain RVG resources. Do not OFFLINE the service groups containing RVG resources.
   - If the application resources are part of the same service group as an RVG resource, then OFFLINE only the application resources. In other words, ensure that the RVG resource remains ONLINE so that the private disk groups containing these RVG objects do not get deported.

\textbf{Note:} You must also stop any remaining applications not managed by VCS.

4. On any node in the cluster, make the VCS configuration writable:

\texttt{# haconf -makerw}
5 On any node in the cluster, list the groups in your configuration:

```
# hagrp -list
```

6 On any node in the cluster, freeze all service groups except the ClusterService group by typing the following command for each group name displayed in the output from step 5.

```
# hagrp -freeze group_name -persistent
```

**Note:** Write down the list of frozen service groups for future use.

7 On any node in the cluster, save the configuration file (`main.cf`) with the groups frozen:

```
# haconf -dump -makero
```

**Note:** Continue only after you have performed steps 3 to step 7 for each cluster.

8 Display the list of service groups that have RVG resources and the nodes on which each service group is online by typing the following command on any node in the cluster:

```
# hares -display -type RVG -attribute State
```

<table>
<thead>
<tr>
<th>Resource</th>
<th>Attribute</th>
<th>System</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>VVRGrp</td>
<td>State</td>
<td>system02</td>
<td>ONLINE</td>
</tr>
<tr>
<td>ORAGrp</td>
<td>State</td>
<td>system02</td>
<td>ONLINE</td>
</tr>
</tbody>
</table>

**Note:** For the resources that are ONLINE, write down the nodes displayed in the System column of the output.

9 Repeat step 8 for each cluster.
10 For private disk groups, determine and note down the hosts on which the disk groups are imported.

See “Determining the nodes on which disk groups are online” on page 201.

11 For shared disk groups, run the following command on any node in the CVM cluster:

```
# vxdctl -c mode
```

Note the master and record it for future use.

**Determining the nodes on which disk groups are online**

For private disk groups, determine and note down the hosts on which the disk groups containing RVG resources are imported. This information is required for restoring the configuration after the upgrade.

**To determine the online disk groups**

1 On any node in the cluster, list the disk groups in your configuration, and note down the disk group names listed in the output for future use:

```
# hares -display -type RVG -attribute DiskGroup
```

*Note: Write down the list of the disk groups that are under VCS control.*

2 For each disk group listed in the output in step 1, list its corresponding disk group resource name:

```
# hares -list DiskGroup=diskgroup Type=DiskGroup
```

3 For each disk group resource name listed in the output in step 2, get and note down the node on which the disk group is imported by typing the following command:

```
# hares -display dg_resname -attribute State
```

The output displays the disk groups that are under VCS control and nodes on which the disk groups are imported.

**Preparing for the upgrade when VCS agents are configured**

If you have configured the VCS agents, it is recommended that you take backups of the configuration files, such as `main.cf` and `types.cf`, which are present in the `/etc/VRTSvcs/conf/config` directory.
To prepare a configuration with VCS agents for an upgrade

1. List the disk groups on each of the nodes by typing the following command on each node:

   # vxdisk -o alldgs list

   The output displays a list of the disk groups that are under VCS control and the disk groups that are not under VCS control.

   **Note:** The disk groups that are not locally imported are displayed in parentheses.

2. If any of the disk groups have not been imported on any node, import them. For disk groups in your VCS configuration, you can import them on any node. For disk groups that are not under VCS control, choose an appropriate node on which to import the disk group. Enter the following command on the appropriate node:

   # vxdg -t import diskgroup

3. If a disk group is already imported, then recover it by typing the following command on the node on which it is imported:

   # vxrecover -bs

4. Verify that all the Primary RLINKs are up to date.

   # vxrlink -g diskgroup status rlink_name

   **Note:** Do not continue until the Primary RLINKs are up-to-date.

Upgrading the array support

The Storage Foundation 5.1 SP1 release includes all array support in a single depot, VRTSaslapm. The array support depot includes the array support previously included in the VRTSvxvm depot. The array support depot also includes support previously packaged as external array support libraries (ASLs) and array policy modules (APMs).

See the 5.1 SP1 Hardware Compatibility List for information about supported arrays.

http://entsupport.symantec.com/docs/330441
When you upgrade Storage Foundation products with the product installer, the installer automatically upgrades the array support. If you upgrade Storage Foundation products with manual steps, you should remove any external ASLs or APMs that were installed previously on your system. The installation of the VRTSvxvm depot exits with an error if external ASLs or APMs are detected.

After you have installed Storage Foundation 5.1 SP1, Symantec provides support for new disk arrays though updates to the VRTSaslapm package.

For more information about array support, see the *Veritas Volume Manager Administrator's Guide*.

### Upgrading the disk layout versions

SFCFS 5.1 SP1 supports disk layouts Versions 4, 5, 6 and 7 for locally mounted file systems and disk layouts Versions 6 and 7 for cluster mounted file systems. If you have cluster mounted file systems with disk layout versions lower than 6, then after upgrading to SFCFS 5.1 SP1, perform the following additional steps to prepare the file system for being mounted on all nodes of the cluster:

**To upgrade the disk layout versions**

1. Select one of the nodes of the cluster and mount the file system locally on this node. For example, mount it without the `-o cluster` option. Enter,

   ```
   # mount -F vxfs block_device_path /mnt1
   ```

2. Current disk layout version on a file system can be found using

   ```
   # fstyp -v char_device_path | grep version | \
   awk '{print $2}'
   ```

3. On the node selected in 1, incrementally upgrade the disk layout of this file system to layout Version 6 or layout Version 7. For example, if you had a cluster mounted file system of disk layout Version 4 while running with SFCFS 3.5 on HP-UX 11i Version 1, after upgrading to SFCFS 5.1 SP1, you would need to upgrade the disk layout to version 6 or version 7 incrementally as follows:

   ```
   # vxupgrade -n 5 /mnt1
   # vxupgrade -n 6 /mnt1
   # vxupgrade -n 7 /mnt1
   ```
On the node selected in 1, after the disk layout has been successfully upgraded, unmount the file system.

```sh
# umount /mnt1
```

This file system can be mounted on all nodes of the cluster using `cfsmount`. 
Performing a typical SFCFS upgrade using the installer

This chapter includes the following topics:

- Performing a full upgrade from SFCFS versions on HP-UX 11i v2 to SFCFS 5.1 SP1
- Performing a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 HP-UX 11iv3
- Performing a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 on the latest HP-UX 11iv3

Performing a full upgrade from SFCFS versions on HP-UX 11i v2 to SFCFS 5.1 SP1

Use these steps to perform a full upgrade from SFCFS 4.x or 5.x on HP-UX 11i v2 to SFCFS 5.1 SP1:

To upgrade from SFCFS versions on HP-UX 11i v2:

1. Log in as superuser to one of the nodes, system01 for example, in the cluster.
2. Create a backup of the existing cluster configuration. Back up the main.cf and types.cf on all cluster nodes:

   ```bash
   # cp /etc/VRTSvcs/conf/config/main.cf /
   /etc/VRTSvcs/conf/config/main.cf.save
   # cp /etc/VRTSvcs/conf/config/types.cf /
   /etc/VRTSvcs/conf/config/types.cf.save
   ```
3 If you created local VxFS mount points on VxVM volumes, added them to the /etc/fstab file, and comment out the mount point entries in the /etc/fstab file.

4 Stop all applications that use VxFS or VxVM disk groups, whether local or CFS.
   If the applications are under VCS control:
   
   ```bash
   # hagrp -offline grp_name -any
   ```
   
   If the applications are not under VCS control:
   Use native application commands to stop the application.

5 Take offline all VCS groups that contain CFSMount and CVMVolDg.
   
   ```bash
   # hagrp -offline group -sys system01
   # hagrp -offline group -sys system02
   ```

6 Unmount all the VxFS file system which is not under VCS control.
   
   ```bash
   # umount /mount_point
   ```

7 Make sure that no processes are running which make use of mounted shared file system or shared volumes.
   
   ```bash
   # fuser -cu mount-point
   ```

8 Stop all VCS service groups.
   To view the current state of the service groups:
   
   ```bash
   # hagrp -state
   ```
   To stop each group:
   
   ```bash
   # hagrp -offline servicegroup -sys node_name
   ```

9 Freeze the VCS service groups. Run the following commands:
   
   ```bash
   # haconf -makerw
   # hagrp -freeze servicegroup -persistent
   # haconf -dump -makero
   ```

10 Stop VCS on all nodes:
   
   ```bash
   # hastop -all -force
   ```
11 If the cluster-wide attribute “UseFence” is set to SCSI3, then reset the value to NONE in the `/etc/VRTSvcs/conf/config/main.cf` file.

12 On each node, edit the `/etc/vxfenmode` file to configure I/O fencing in disabled mode.

```
# cat /etc/vxfenmode
vxfen_mode=disabled
```

13 On each node, change LLT_START=0 in the file `/etc/rc.config.d/lltconf`.

14 On each node, remove the following device files:

```
# rm -f /dev/llt
# rm -f /dev/gab*
# rm -f /dev/vxfen
```

15 Upgrade the operating system from HP-UX 11i v2 to HP-UX 11i v3.

To upgrade from Veritas 5.0 releases on 11i v2, select the Base-VxFS-50, Base-VxVM-50 and Base-VxTools-50 bundles while using `update-ux(1M)`.

16 If any patches to the HP-UX 11i v3 are required, install all the prerequisite patches on all nodes before upgrading the Veritas products.

17 Install SFCFS 5.1 SP1.

```
# ./installer
```

From the installation menu, choose the G option for install and enter the number for VERITAS Storage Foundation Cluster File System.

18 Uncomment the VxFS mount point entries in the `/etc/fstab` file.

19 Reboot all the nodes.

```
# /usr/sbin/shutdown -r now
```

20 Check for hastatus –summ.

21 Post Upgrade Tasks: Enable fencing.

```
# hastop -all
# cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
# /sbin/init.d/vxfen stop
# /sbin/init.d/vxfen start
```
Set the clusterwide attribute "UseFence" to use SCSI3. Add the following line to the `/etc/VRTSvcs/conf/config/main.cf` file:

```
UseFence=SCSI3
```

Start the VCS engine on each system:

```
# hastart
```

---

### Performing a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 HP-UX 11iv3

Use this full upgrade procedure if the operating system upgrade is not required.

To perform a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 HP-UX 11iv3

1. Take offline all VCS groups that contain `CFSMount` and `CVMVolDg`
   
   ```
   # hagrp -offline group -sys system01
   # hagrp -offline group -sys system02
   ```

2. Unmount all the non-system VxFS file systems which are not under VCS control.
   
   ```
   # umount /mount_point
   ```

---

Note: Here the CVM is up.

---

3. Upgrade the stack following the installation of all the required patches.
4. Reboot the cluster.
   
   ```
   # /usr/sbin/shutdown -r -y now
   ```

---

### Performing a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 on the latest HP-UX 11iv3

Use this full upgrade procedure if the operating system upgrade is required.
To perform a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 on the latest HP-UX 11iv3

1. Log in as superuser to one of the nodes in the cluster.
2. If you have created VxFS mount points on VxVM volumes, added them to the /etc/fstab file, and comment out the mount point entries in the /etc/fstab file.
3. Stop all applications that use VxFS or VxVM disk groups, whether local or CFS. If the applications are under VCS control:
   
   ```
   # hagrp -offline grp_name -any
   ```

   If the applications are not under VCS control:

   Use native application commands to stop the application.

4. Take offline all VCS groups that contain CFSMount and CVMVolDg
   
   ```
   # hagrp -offline group -sys system01
   # hagrp -offline group -sys system02
   ```

5. Unmount all the non-system VxFS file systems which are not under VCS control.
   
   ```
   # umount /mount_point
   ```

6. Make sure that no processes which make use of mounted shared file system or shared volumes are running.
   
   ```
   # fuser -cu mount-point
   ```

7. Stop all VCS service groups.

   To view the current state of the service groups:

   ```
   # hagrp -state
   ```

   To stop each group:

   ```
   # hagrp -offline servicegroup -sys node_name
   ```
Freeze all the VCS service groups by running the following commands:

```
# haconf -makerw
# hagrp -freeze servicegroup -persistent
# haconf -dump -makero
```

Stop VCS on all the nodes:

```
# hastop -all
```

If the cluster-wide attribute “UseFence” is set to SCSI3, then reset the value to NONE in the `/etc/VRTSvcs/conf/config/main.cf` file.

On each node, edit the `/etc/vxffenmode` file to configure I/O fencing in disabled mode.

```
# cat /etc/vxffenmode

vxffen_mode=disabled
```

If the HP-UX 11i v3 10 OEUR release is not already installed, you can now upgrade the HP-UX operating system to the latest available HP-UX 11i version 3 fusion release.

Install all the prerequisite patches on all the nodes.

Install SFCFS 5.1 SP1.

```
# ./installer
```

From the Installation menu, choose the G option for install and enter the number for Veritas Storage Foundation Cluster File System.

Uncomment the entries for the non-system VxFS mounts from the `/etc/fstab` file.

Reboot all the nodes

```
# /usr/sbin/shutdown -r now
```

Enable I/O fencing:

```
# /opt/VRTS/bin/hastop -all
```
18 Execute the following steps on all the nodes:

```
# cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
# /sbin/init.d/vxfen stop
# /sbin/init.d/vxfen start
```

19 Set the clusterwide attribute "UseFence" to use SCSI3. Add the following line to the `/etc/VRTSvcs/conf/config/main.cf` file:

```
UseFence=SCSI3
```

20 Start the VCS engine on each system:

```
# /opt/VRTS/bin/hastart
```
Performing a typical SFCFS upgrade using the installer

Performing a full upgrade from SFCFS 5.x on HP-UX 11iv3 to 5.1 SP1 on the latest HP-UX 11iv3
Performing a phased upgrade

This chapter includes the following topics:

- Performing a phased upgrade from version 5.x on HP-UX 11i v3 to Veritas Storage Foundation Cluster File System 5.1 SP1
- Performing phased upgrade of SFCFS from versions 4.x or 5.x on HP-UX 11i v2 to 5.1SP1
- Upgrading Storage Foundation Cluster File System and High Availability software from a release prior to 5.1 SP1

Performing a phased upgrade from version 5.x on HP-UX 11i v3 to Veritas Storage Foundation Cluster File System 5.1 SP1

Perform the following procedures to upgrade SFCFS clusters from version 5.x on HP-UX 11i v3 to Veritas Storage Foundation Cluster File System 5.1 SP1.

The phased upgrade involves the following steps:

- Upgrading the first half of the cluster, system01 and system02.

  **Note:** Your downtime starts after you complete the upgrade of the first half of the cluster.

- Stopping the second half of the cluster, system03 and system04.
- Bringing online the first half of the cluster, system01 and system02.
Performing a phased upgrade from version 5.x on HP-UX 11i v3 to Veritas Storage Foundation Cluster File System 5.1 SP1

Note: Your downtime ends after you bring the first half of the cluster online.

- Upgrading the second half of the cluster, system03 and system04.

Perform the following steps on the first half of the cluster, system01 and system02.

**To upgrade the first half of the cluster**

1. Stop all the applications on the nodes that are not under VCS control. Use native application commands to stop the applications.

2. Switch the failover groups from the first half of the cluster to one of the nodes in the second half of the cluster.

   ```
   # hagrp -switch failover_group -to system03
   ```

3. Stop all VCS service groups.

   ```
   # hagrp -offline group_name -sys system01
   # hagrp -offline group_name -sys system02
   ```

4. Freeze the nodes in the first half of the cluster

   ```
   # haconf makerw
   # hasys -freeze -persistent system01
   # hasys -freeze -persistent system02
   # haconf -dump -makero
   ```

5. Stop VCS on the first half of the cluster:

   ```
   # hastop -local -force
   ```

6. If you created local VxFS mount points on VxVM volumes, added them to the `/etc/fstab` file, and comment out the mount point entries in the `/etc/fstab` file.

7. Set the LLT_START attribute to 0 in the `/etc/rc.config.d/litconf` file:

   ```
   LLT_START=0
   ```

8. On each node of the first half of the cluster, edit the `/etc/vxfenmode` file to configure I/O fencing in disabled mode.

   ```
   # cat /etc/vxfenmode
   vxfen_mode=disabled
   ```
9 If the cluster-wide attribute `UseFence` is set to SCSI3, then reset the value to NONE in the `/etc/VRTSvcs/conf/config/main.cf` file.

10 Stop all the modules on the first half of the cluster.

```bash
# /sbin/init.d/odm stop
# /sbin/init.d/vxfen stop
# /sbin/gabconfig -U
# kmodule vxfen=unused
# kmodule odm=unused
# kmodule gab=unused
# lltconfig -U
# kmodule llt=unused
```

11 On each node of the first half of the cluster, remove the following device files:

```bash
# rm -f /dev/llt
# rm -f /dev/gab*
# rm -f /dev/vxfen
```

12 Upgrade the HP-UX operating system to HP-UX 11.31 Mar 10 fusion.

See “Upgrading the HP-UX operating system” on page 237.

13 Upgrade SFCFS:

```bash
# ./installer
```

**Note:** DO NOT reboot the cluster.

After the installation completes, perform the following steps on the second half of the cluster.

**Note:** Your downtime starts now.

Perform the following steps on the second half of the cluster, system03 and system04, to stop the second half of the cluster.
To stop the second half of the cluster

1. Stop all the applications on the node that are not under VCS control. Use native application commands to stop the applications.

2. Stop all VCS service groups.

   # hagrp -offline group_name -sys system03
   # hagrp -offline group_name -sys system04

3. Freeze the nodes in the second half of the cluster

   # haconf makerw
   # hasys -freeze group_name -persistent
   # haconf -dump -makero

4. Stop VCS on the second half of the cluster:

   # hastop -local -force

5. If you created local VxFS mount points on VxVM volumes, added them to the /etc/fstab file, and comment out the mount point entries in the /etc/fstab file.

6. Set the LLT_START attribute to 0 in the /etc/rc.config.d/lltconf file:

   LLT_START=0

7. On each node of the second half of the cluster, edit the /etc/vxfenmode file to configure I/O fencing in disabled mode.

   # cat /etc/vxfenmode
   vxfen_mode=disabled

8. If the cluster-wide attribute UseFence is set to SCSI3, then reset the value to NONE in the /etc/VRTSvcs/conf/config/main.cf file.
9  Stop all the modules on the second half of the cluster:

```
# /sbin/init.d/odm stop
# /sbin/init.d/vxfen stop
# /sbin/gabconfig -U
# kcmodule vxfen=unused
# kcmodule odm=unused
# kcmodule gab=unused
# lltconfig -U
# kcmodule llt=unused
```

10 On each node of the second half of the cluster, remove the following device files:

```
# rm -f /dev/llt
# rm -f /dev/gab*
# rm -f /dev/vxfen
```

Perform the following steps on the first half of the cluster, system01 and system02, to bring the first half of the cluster online.

**To bring the first half of the cluster online**

1  Uncomment the VxFS mount point entries in the `/etc/fstab` file.

2  Mount the VxFS file systems.

3  Enable fencing:

```
# cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
```

4  Remove the following line from the `/etc/VRTSvcs/conf/config/main.cf` file:

```
Frozen=1
```

5  Set the clusterwide attribute `UseFence` to use SCSI3. Add the following line to the `/etc/VRTSvcs/conf/config/main.cf` file:

```
UseFence=SCSI3
```
6. Reboot the first half of the cluster:
   
   ```
   # /usr/sbin/shutdown -r now
   ```

7. After the nodes come up, seed the cluster membership:

   ```
   # gabconfig -x
   ```

   The first half of the cluster is now up and running.

   **Note:** The downtime ends here.

Perform the following steps on the second half of the cluster, system03 and system04, to upgrade the second half of the cluster.

**To upgrade the second half of the cluster**

1. Upgrade the HP-UX operating system to HP-UX 11.31 Mar 10 fusion.
   
   See “Upgrading the HP-UX operating system” on page 237.

2. Upgrade SFCFS:

   ```
   # ./installer
   ```

   **Note:** DO NOT reboot the cluster.

3. Uncomment the VxFS mount point entries in the `/etc/fstab` file on the second half of the cluster.

4. Mount the VxFS file systems.

5. Enable fencing:

   ```
   # cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
   ```

6. Reboot the second half of the cluster:

   ```
   # /usr/sbin/shutdown -r now
   ```

   The nodes system03 and system04 now join the first half of the cluster.
Performing phased upgrade of SFCFS from versions 4.x or 5.x on HP-UX 11i v2 to 5.1SP1

The phased upgrade involves the following steps:

- Upgrading the first half of the cluster, system01 and system02.

  **Note:** Your downtime starts after you complete the upgrade of the first half of the cluster.

- Stopping the second half of the cluster, system03 and system04.

- Bringing online the first half of the cluster, system01 and system02.

  **Note:** Your downtime ends after you bring the first half of the cluster online.

- Upgrading the second half of the cluster, system03 and system04.

Perform the following steps on the first half of the cluster, system01 and system02, to upgrade the first half of the cluster.

**To upgrade the first half of the cluster**

1. Stop all the applications that are not configured under VCS.

2. Switch the failover groups from the first half of the cluster to one of the nodes in the second half of the cluster:

   ```
   # hagrp -switch failover_group -to system03
   ```

3. Stop all VCS service groups.

   ```
   # hagrp -offline group_name -sys system01
   # hagrp -offline group_name -sys system02
   ```

4. Freeze the nodes in the first half of the cluster

   ```
   # haconf makerw
   # hasys -freeze -persistent system01
   # hasys -freeze -persistent system02
   # haconf -dump -makero
   ```
5 Stop VCS on the first half of the cluster:
   
   ```
   # hastop -local -force
   ```

6 If you created local VxFS mount points on VxVM volumes, added them to `/etc/fstab` file, and comment out the mount point entries in the `/etc/fstab` file.

7 Set the LLT_START attribute to 0 in the `/etc/rc.config.d/lltconf` file:

   ```bash
   LLT_START=0
   ```

8 On each node of the first half of the cluster, edit the `/etc/vxfenmode` file to configure I/O fencing in disabled mode.

   ```
   # cat /etc/vxfenmode
   vxfen_mode=disabled
   ```

9 If the cluster-wide attribute `UseFence` is set to `SCSI3`, then reset the value to `NONE` in the `/etc/VRTSvcs/conf/config/main.cf` file.

10 Stop all the modules on the first half of the cluster.

   ```
   # /sbin/init.d/odm stop
   # /sbin/init.d/vxfen stop
   # /sbin/gabconfig -U
   # kcmodule vxfen=unused
   # kcmodule odm=unused
   # kcmodule gab=unused
   # lltconfig -U
   # kcmodule llt=unused
   ```

11 On each node of the first half of the cluster, remove the following device files:

   ```
   # rm -f /dev/llt
   # rm -f /dev/gab*
   # rm -f /dev/vxfen
   ```
12 Upgrade the operating system choosing three Base Bundles "Base-VxFS-50, Base-VxVM-50, Base-VxTools-50".

13 Upgrade SFCFS:

# ./installer

Choose the upgrade option "G" when the installer prompts you.

---

**Note:** DO NOT reboot the cluster.

---

Perform the following steps on the second half of the cluster, system03 and system04, to stop the second half of the cluster.

---

**Note:** The downtime starts now.

### To stop the second half of the cluster

1. Stop all the applications that are not configured under VCS.
2. Stop all VCS service groups.
   
   # hagrp -offline group_name -sys system03
   
   # hagrp -offline group_name -sys system04

3. Freeze the VCS service groups on the second half of the cluster:
   
   # haconf -makerw
   
   # hagrp -freeze group_name -persistent
   
   # haconf -dump -makero

4. Stop VCS on the second half of the cluster:
   
   # hastop -local -force

5. If you created local VxFS mount points on VxVM volumes, added them to /etc/fstab file, and comment out the mount point entries in the /etc/fstab file.

6. Set the LLT_START attribute to 0 in the /etc/rc.config.d/lltconf file:
   
   LLT_START=0
7 On each node of the second half of the cluster, edit the `/etc/vxfenmode` file to configure I/O fencing in disabled mode:

```
# cat /etc/vxfenmode
vxfen_mode=disabled
```

8 If the cluster-wide attribute `UseFence` is set to `SCSI3`, then reset the value to `NONE` in the `/etc/VRTSvcs/conf/config/main.cf` file.

9 Stop all the modules on the second half of the cluster:

```
# /sbin/init.d/odm stop
# /sbin/init.d/vxfen stop
# /sbin/gabconfig -U
# kcmodule vxfen=unused
# kcmodule edm=unused
# kcmodule gab=unused
# lltconfig -U
# kcmodule llt=unused
```

10 On each node of the second half of the cluster, remove the following device files:

```
# rm -f /dev/llt
# rm -f /dev/gab*
# rm -f /dev/vxfen
```

Perform the following steps on the first half of the cluster, system01 and system02, to bring the first half of the cluster online.

**To bring the first half of the cluster online**

1 Uncomment the VxFS mount point entries in the `/etc/fstab` file.

2 Mount the VxFS file systems.

3 Enable fencing:

```
# cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
```

4 Remove the following line from the `/etc/VRTSvcs/conf/config/main.cf` file:

```
Frozen=1
```
5 Set the clusterwide attribute `UseFence` to use SCSI3. Add the following line to the `/etc/VRTSvcs/conf/config/main.cf` file:

```
UseFence=SCSI3
```

6 Reboot the first half of the cluster:

```
#/usr/sbin/shutdown -r now
```

7 After the nodes come up, seed the cluster membership:

```
#/gabconfig -x
```

The first half of the cluster is now up and running.

---

**Note:** The downtime ends here.

Perform the following steps on the second half of the cluster, system03 and system04, to upgrade the second half of the cluster.

**To upgrade the second half of the cluster**

1 Upgrade the operating system.

See “Upgrading the HP-UX operating system” on page 237.

2 Upgrade SFCFS:

```
#/installsfcfs system03 system04
```

**Note:** DO NOT reboot the cluster.

3 Uncomment the VxFS mount point entries in the `/etc/fstab` file.

4 Mount the VxFS file systems.

5 Enable fencing:

```
#/cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode
```

6 Reboot the second half of the cluster:

```
#/usr/sbin/shutdown -r now
```

The nodes system03 and system04 now join the first half of the cluster.
Upgrading Storage Foundation Cluster File System and High Availability software from a release prior to 5.1 SP1

This section contains procedures for the Veritas Storage Foundation Cluster File System upgrade.

Upgrading Storage Foundation or Storage Foundation High Availability using the script-based installer

You can use the script-based installer to upgrade Storage Foundation or Storage Foundation High Availability.

Upgrading from Storage Foundation or Storage Foundation and High Availability 5.0_11iv3, 5.0.1, 5.0.1 RP1, or 5.0.1 RP2

This procedure describes upgrading from Storage Foundation or Storage Foundation and High Availability 5.0_11iv3, 5.0.1, or 5.0.1 RP1 on HP-UX 11i v3 to 5.1 SP1 on HP-UX 11i v3.

After successful completion of the upgrade, disk groups that you created in previous versions are accessible.

To upgrade from Storage Foundation or Storage Foundation and High Availability on HP-UX 11i v3

1. Perform the necessary pre-upgrade tasks such as resynchronizing existing database snapshots.
   
   See “Preparing to upgrade the Veritas software” on page 194.

2. Upgrade the HP-UX operating system to the latest available HP-UX 11i v3 fusion release.
   
   See “Upgrading the HP-UX operating system” on page 237.

3. If patches to HP-UX 11i v3 are required, apply the patches before upgrading the product.

4. Install Storage Foundation 5.1 SP1 for HP-UX 11i v3 using the installer script.
   
   # ./installer

5. Enter G to upgrade and press Return.
6 You are prompted to enter the system names on which the software is to be installed. Enter the system name or names and then press Return.

Depending on your existing configuration, various messages and prompts may appear. Answer the prompts appropriately.

7 You are prompted to agree with the End User License Agreement. Enter y and press Return.

Do you agree with the terms of the End User License Agreement as specified in the storage_foundation/EULA/en/EULA_SF_Ux_5.1SP1.pdf file present on media? [y,n,q,?] y

8 The installer lists the packages that will be installed or updated. You are prompted to confirm that you are ready to stop SF processes.

Do you want to stop SF processes now? [y,n,q,?] (y) y

If you select y, the installer stops the product processes and makes some configuration updates before upgrading.

9 The installer uninstalls and reinstalls the listed packages.

10 Uncomment the entries in the /etc/fstab file which were commented as part of the pre-upgrade steps.

11 Reboot all the nodes.

   # /usr/sbin/shutdown -r now

12 Check if the VEA service was restarted:

   # /opt/VRTS/bin/vxsvcctrl status

13 If the VEA service is not running, restart it:

   # /opt/VRTS/bin/vxsvcctrl start

Upgrading from previous versions of Storage Foundation on HP-UX 11i v2

Use this procedure to upgrade Storage Foundation from a previous version on HP-UX 11i v2. You can upgrade to Storage Foundation 5.1 SP1 from Storage Foundation 4.1, 4.1 MP1, 4.1 MP2, 5.0. 5.0 MP1, or 5.0 MP2 on HP-UX 11i v2.

After successful completion of the upgrade, any disk groups that were created in Storage Foundation 4.1, 4.1 MP1, 4.1 MP2, 5.0. 5.0 MP1, or 5.0 MP2 are accessible by Storage Foundation 5.1 SP1.
Note: If you are upgrading from Storage Foundation for Oracle:

1. Perform the necessary preupgrade tasks such as resynchronizing existing database snapshots.
   
   See “Preparing to upgrade the Veritas software” on page 194.

2. If you have any external Array Policy Modules (APMs) installed, uninstall the APMs. The following warning message displays during the OS upgrade and also when you issue an administrative command for HP-UX kernel modules after the upgrade, until SF 5.0 on HP-UX 11i v3 is installed:

   WARNING: The file '/usr/conf/mod/dmpXXX.1' does not contain valid kernel code. It will be ignored.

   This message can be ignored and does not affect the functionality of SF.

3. Upgrade the HP-UX operating system to the latest available HP-UX 11i v3 fusion release.

   See “Upgrading the HP-UX operating system” on page 237.

4. If patches to HP-UX 11i v3 are required, apply the patches before upgrading the product.

5. Install Storage Foundation 5.1 SP1 for HP-UX 11i v3 using the installer script.

   # ./installer

6. Enter G to upgrade and press Return.

7. You are prompted to enter the system names on which the software is to be installed. Enter the system name or names and then press Return.

   Depending on your existing configuration, various messages and prompts may appear. Answer the prompts appropriately.

8. You are prompted to agree with the End User License Agreement. Enter y and press Return.

   Do you agree with the terms of the End User License Agreement as specified in the storage_foundation/EULA/en/EULA_SF_Ux_5.1SP1.pdf file present on media? [y,n,q,?] y
9 The installer lists the packages that will be installed or updated. You are prompted to confirm that you are ready to stop SF processes.

Do you want to stop SF processes now? [y,n,q,?] (y) y

If you select y, the installer stops the product processes and makes some configuration updates before upgrading.

10 The installer uninstalls and reinstalls the listed packages.

11 Reboot all the nodes.

    # /usr/sbin/shutdown -r now

12 Check if the VEA service was restarted:

    # /opt/VRTS/bin/vxsvcctrl status

13 If the VEA service is not running, restart it:

    # /opt/VRTS/bin/vxsvcctrl start

Upgrading from Storage Foundation 3.5 on 11i v1 to Storage Foundation 5.1 SP1 on HP-UX 11i v3

This procedure describes upgrading Storage Foundation 3.5 on HP-UX 11i v1 to Storage Foundation 5.1 SP1 on HP-UX 11i v3. Upgrading from HP-UX 11i v1 requires an intermediate upgrade to HP-UX 11i v2 for Storage Foundation and Storage Foundation Clustered File System.

Veritas Volume Manager 3.5 and Veritas Volume Manager 5.1 SP1 both support disk group version 90. Therefore, any disk groups with version 90 are accessible by Storage Foundation 5.1 SP1 after the upgrade. However, certain features in Storage Foundation 5.1 SP1 may require the latest disk group version. Therefore, we recommend upgrading the disk group.

To upgrade from Storage Foundation 3.5 on HP-UX 11i v1 to Storage Foundation 5.1 SP1 on HP-UX 11i v3

1 Stop activity to all Storage Foundation volumes. For example, stop any applications such as databases that access the volumes, and unmount any file systems that have been created on the volumes.

2 Upgrade from HP-UX 11i v1 to HP-UX 11i v2 using practices recommended by HP. HP-UX 11i v2 includes VxVM 4.1 by default. All disk groups created using Storage Foundation 3.5 on HP-UX 11i v1 would be accessible.
Upgrading from HP-UX 11i v2 to the latest available HP-UX 11i v3 fusion release, using practices recommended by HP. The HP-UX 11i v3 fusion release includes VxVM 5.0 by default.

3 If patches to HP-UX 11i v3 are required, apply the patches before upgrading the product.

5 Install Storage Foundation 5.1 SP1 for HP-UX 11i v3.

6 Start Storage Foundation 5.1 SP1 HP-UX 11i v3 using the `installsf -start` option.

Upgrading from VxVM 5.0 on HP-UX 11i v3 to VxVM 5.1 SP1 using integrated VxVM 5.1 SP1 package for HP-UX 11i v3

You can upgrade from VxVM 5.0 on HP-UX 11i v3 to VxVM 5.1 SP1 on HP-UX 11i v3. Use the integrated VxVM 5.1 SP1 package for HP-UX 11i v3 from the ignite depot.

To upgrade using the integrated VxVM 5.1 SP1 package from the ignite depot

1 Use HP recommended steps to integrate VxVM 5.1 SP1 package with the latest 11i v3 fusion.

2 Stop activity to all Storage Foundation volumes. For example, stop any applications such as databases that access the volumes, and unmount any file systems that have been created on the volumes.

3 Upgrade the HP-UX 11i v3 operating system to the latest fusion using the integrated VxVM 5.1 SP1 package. This process installs VxVM 5.1 SP1 package with the operating system. All disk groups that were created using VxVM 5.0 11i v3 are accessible.

Upgrading from Storage Foundation High Availability from 5.0_11iv3, 5.0.1, or 5.0.1 RP1 on HP-UX 11i v3 to 5.1 SP1 on HP-UX 11i v3

If your systems are already running Storage Foundation High Availability 5.0_11iv3, 5.0.1, or 5.0.1 RP1 on HP-UX 11i v3, this section describes how to upgrade to Veritas Storage Foundation High Availability 5.1 SP1. The operating system must be at a supported level for this upgrade.

This procedure describes upgrading from Storage Foundation High Availability 5.0_11iv3, 5.0.1, or 5.0.1 RP1 on HP-UX 11i v3 to Storage Foundation High Availability 5.1 SP1 on HP-UX 11i v3.
After successful completion of the upgrade, any disk groups that were created in Storage Foundation High Availability 5.0 are accessible by Storage Foundation High Availability 5.1 SP1.

Note: If you are upgrading from Storage Foundation for Oracle:

To upgrade from SFHA or SFORA HA 5.0 on 11.31 to 5.1 SP1 on 11.31

1. Stop activity to all SFHA volumes. For example, stop any applications such as databases that access the volumes, and unmount any file systems that have been created on the volumes.

2. Offline all the VCS service groups.
   
   # hagrp -offline servicegroup -sys node_name

3. Stop VCS if it is already running. On any node, run the following command:

   # /opt/VRTS/bin/hastop -all

4. If fencing is configured with VCS, you must disable fencing before proceeding to upgrade.
   
   To disable fencing, perform the following steps:

   ■ If the cluster-wide attribute “UseFence” is set to SCSI3, then reset the value to NONE in the /etc/VRTSvcs/conf/config/main.cffile

   ■ On each node, edit the /etc/vxfenmode file to configure vxffen in disabled mode.

   # cat /etc/vxfenmode
   
   vxffen_mode=disabled

   ■ Stop I/O fencing on each node:

   # /sbin/init.d/vxffen stop
   
   # /sbin/vxffenconfig -U

5. Upgrade the HP-UX operating system to the latest available HP-UX 11i v3 fusion release.

6. If patches to HP-UX 11i v3 are required, apply the patches before upgrading the product.
7 Install Storage Foundation High Availability 5.1 SP1 for HP-UX 11i v3 using the installer script.

# ./installer

8 Enter G to upgrade and press Return.

9 You are prompted to enter the system names on which the software is to be installed. Enter the system name or names and then press Return.

Depending on your existing configuration, various messages and prompts may appear. Answer the prompts appropriately.

10 You are prompted to agree with the End User License Agreement. Enter y and press Return.

Do you agree with the terms of the End User License Agreement as specified in the storage_foundation_high_availability/EULA/lang/EULA_SFHA_Ux_5.1SP1.pdf file present on media? [y,n,q,?] y

11 The installer lists the packages that will be installed or updated. You are prompted to confirm that you are ready to stop SFHA processes.

Do you want to stop SFHA processes now? [y,n,q,?] (y) y

If you select y, the installer stops the product processes and makes some configuration updates before upgrading.

12 The installer uninstalls and reinstalls the listed packages.

13 Enable I/O fencing if required. Follow the below steps to enable the fencing.

- Execute the following steps on all the nodes:

  # cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode

- Set the clusterwide attribute "UseFence" to use SCSI3. Add the following line to the /etc/VRTSvcs/conf/config/main.cf file:

  UseFence=SCSI3

- Verify the syntax of the /etc/VRTSvcs/conf/config/main.cf file by running the following commands:

  # cd /etc/VRTSvcs/conf/config
  # /opt/VRTS/bin/hacf -verify .
14 Reboot all the nodes.

    # /usr/sbin/shutdown -r now

15 Start Storage Foundation High Availability 5.1 SP1 for HP-UX 11i v3 using
the following command:

    # ./installsfha -start

16 Check if the VEA service was restarted:

    # /opt/VRTS/bin/vxsvcctrl status

17 If the VEA service is not running, restart it:

    # /opt/VRTS/bin/vxsvcctrl start

18 Disk groups that were created using VxVM 5.0 can be imported after upgrading
to VxVM 5.1.100. However, we recommend upgrading the VxVM disk groups
to the latest version.

Upgrading from SFHA or SFORAHA 4.1, 4.1 MP1, 4.1 MP2, 5.0, 5.0 MP1, or 5.0 MP2 on HP-UX 11i v2 to SFHA 5.1 SP1 on HP-UX 11i v3

If your systems are already running Storage Foundation High Availability 4.1, 4.1 MP1, 4.1 MP2, 5.0, 5.0 MP1, or 5.0 MP2 on HP-UX 11i v2, you must upgrade the operating system to HP-UX 11i v3. Then upgrade Storage Foundation High Availability to Storage Foundation High Availability 5.1 SP1.

- Prepare to upgrade Veritas products
  See “Preparing to upgrade the Veritas software” on page 194.

- Prepare to upgrade SFHA or SFORAHA on HP-UX 11iv2 to HP-UX 11iv3
  See “Preparing to upgrade SFHA or SFORAHA on HP-UX 11i v2 to HP-UX 11i v3” on page 232.

- Upgrade HP-UX
  See “Upgrading the HP-UX operating system” on page 237.

- Upgrade SFHA
  See “Upgrading SFHA on HP-UX 11i v2 to 5.1 SP1” on page 233.
Preparing to upgrade SFHA or SFORAHA on HP-UX 11i v2 to HP-UX 11i v3

Perform the following steps before you upgrade SFHA or SFORAHA on HP-UX 11i v2 to SFHA on HP-UX 11i v3.

To prepare for upgrading SFHA or SFORAHA on HP-UX 11i v2 to HP-UX 11iv3

1. Perform the necessary pre-upgrade steps before upgrading the product stack to SFHA 5.1SP1.
2. Take all the service groups offline.
   ```
   # hagrp -offline servicegroup1 -sys host1
   ```
3. Unmount all the file systems from all the nodes that are not under VCS control.
   ```
   # umount /mnt1
   ```
4. Freeze all the service groups in the configuration.
   ```
   # haconf -makerw
   # hagrp -freeze servicegroup1 -persistent
   # hagrp -dump -makero
   ```
5. Stop VCS on all the nodes. Run the following command on any one node in the cluster.
   ```
   # hastop -all
   ```
6. If fencing is configured with VCS, you must disable fencing before proceeding to upgrade.

   To disable fencing, perform the following steps:
   - If the cluster-wide attribute “UseFence” is set to SCSI3, reset the value to NONE in the `/etc/VRTSvcs/conf/config/main.cf` file.
   - On each node, edit the `/etc/vxfenmode` file to configure I/O fencing in disabled mode.
     ```
     # cat /etc/vxfenmode
     vxfen_mode=disabled
     ```
   - Stop I/O fencing on each node:
     ```
     # /sbin/init.d/vxfen stop
     ```
Upgrading HP-UX

Upgrading HP-UX

Upgrade the HP-UX operating system to the latest available HP-UX 11i v3 fusion release. The Base-VxFS-50, Base-VxVM-50 and Base-VxTools-50 bundles need to be selected while upgrading using update-ux(1M).

If patches to HP-UX 11i v3 are required, apply the patches before upgrading the Veritas product.

See “Upgrading the HP-UX operating system” on page 237.

Upgrading SFHA on HP-UX 11i v2 to 5.1 SP1

Use the product installer to upgrade the packages of SFHA from 4.1 or 5.0 to SFHA 5.1SP1. SFHA 5.1SP1 is only supported on HP-UX 11i v3. If you are already running Storage Foundation High Availability 4.1 or 5.0 on HP-UX 11i v2, you must upgrade the operating system to HP-UX 11i v3. Then upgrade Storage Foundation High Availability to Storage Foundation High Availability 5.1 SP1.

Note: If you are upgrading from Storage Foundation for Oracle:

To upgrade from Storage Foundation HA 4.1 or 5.0 on HP-UX 11i v2 to Storage Foundation HA 5.1 SP1

1 Check if the VEA service is running:

   # /opt/VRTS/bin/vxsvcctrl status

2 If the VEA service is running, stop it:

   # /opt/VRTS/bin/vxsvcctrl stop

3 Insert the appropriate software disc into your system's DVD drive.

4 Create a directory in which to mount the software disc and mount the disc using the appropriate drive name. For example:

   # mkdir -p /dvdrom
   # /usr/sbin/mount -F cdfs /dev/dsk/c3t2d0 /dvdrom

5 Change to the top-level directory on the disc:

   # cd /dvdrom
6  Install Storage Foundation High Availability 5.1 SP1 on HP-UX 11i v3 using the installer script.

   # ./installer

7  Enter G to upgrade and press Return.

8  You are prompted to enter the system names on which the software is to be installed. Enter the system name or names and then press Return.

   Depending on your existing configuration, various messages and prompts may appear. Answer the prompts appropriately.

9  You are prompted to agree with the End User License Agreement. Enter y and press Return.

   Do you agree with the terms of the End User License Agreement as specified in the storage_foundation/EULA/en/EULA_SF_Ux_5.1SP1.pdf file present on media? [y,n,q,?] y

10 The installer lists the packages that will be installed or updated. You are prompted to confirm that you are ready to stop SF processes.

   Do you want to stop SF processes now? [y,n,q,?] (y) y

   If you select y, the installer stops the product processes and makes some configuration updates before upgrading.

11 The installer uninstalls and reinstalls the listed packages.

12 Uncomment the entries in /etc/fstab which were commented as part of the pre-upgrade steps.

13 Enable I/O fencing if required. Perform the following steps to enable fencing.

   ■ Change the /etc/vxfenmode file to enable fencing.

      # cp /etc/vxfen.d/vxfenmode_scsi3_dmp /etc/vxfenmode

   ■ Set the clusterwide attribute "UseFence" to use SCSI3. Add the following line to the /etc/VRTSvcs/conf/config/main.cf file:

      UseFence=SCSI3

   ■ Verify the syntax of the /etc/VRTSvcs/conf/config/main.cf file by running the following commands:
# cd /etc/VRTSvcs/conf/config
# /opt/VRTS/bin/hacf -verify .

14 Reboot all the nodes.

# /usr/sbin/shutdown -r now

15 After reboot, check if the VEA service has restarted:

# /opt/VRTS/bin/vxsvcctrl status

16 If the VEA service is not running, restart it:

# /opt/VRTS/bin/vxsvcctrl start

17 Disk groups that were created using VxVM 4.1 or VxVM 5.0 can be imported after upgrading to VxVM 5.1.100. However, we recommend upgrading the VxVM disk groups to the latest version.

18 Once the product is up and running, perform all the necessary post-upgrade steps. See chapter 15.
Performing a phased upgrade

Upgrading Storage Foundation Cluster File System and High Availability software from a release prior to 5.1 SP1
Upgrading the operating system

This chapter includes the following topics:

- Upgrading the HP-UX operating system

Upgrading the HP-UX operating system

If you are on an unsupported version of the operating system, you need to upgrade it to HP-UX B.11.31.1009, HP-UX 11i Version 3 September 2010 Operating Environments Update Release or later.

If you are upgrading the operating system from HP-UX 11i v2, make sure that you choose the following depots along with the HP-UX 11i v3 September 2010 OEUR release depots:

- Base-VxFS-50
- Base-VxTools-50
- Base-VxVM-50

To upgrade the operating system from HP-UX 11i v2, run the `update-ux` command specifying the Veritas depots along with the HP-UX operating system depots:

```
# swinstall -s os_path Update-UX
# update-ux -s os_path HPUX11i-DC-OE \
Base-VxFS-50 Base-VxTools-50 Base-VxVM-50
```

where `os_path` is the full path of the directory containing the operating system depots.

To upgrade the operating system from HP-UX 11i v3, run the `update-ux` command as follows:
# update-ux -s os_path HPUX11i-DC-OE

where `os_path` is the full path of the directory containing the operating system depots.

For detailed instructions on upgrading the operating system, see the operating system documentation.
Upgrading Veritas Volume Replicator

This chapter includes the following topics:

- Upgrading Veritas Volume Replicator

Upgrading Veritas Volume Replicator

If a previous version of Veritas Volume Replicator (VVR) is configured, the product installer upgrades VVR automatically when you upgrade the Storage Foundation products.

See “Upgrading VVR without disrupting replication” on page 239.

Upgrading VVR without disrupting replication

This section describes the upgrade procedure from an earlier version of VVR to the current version of VVR when replication is in progress, assuming that you do not need to upgrade all the hosts in the RDS simultaneously.

You may also need to set up replication between versions.

See “Planning an upgrade from the previous VVR version” on page 197.

When both the Primary and the Secondary have the previous version of VVR installed, the upgrade can be performed either on the Primary or on the Secondary. We recommend that the Secondary hosts be upgraded before the Primary host in the RDS. This section includes separate sets of steps, for the Primary upgrade and for the Secondary upgrade.
Note: If you have a cluster setup, you must upgrade all the nodes in the cluster at the same time.

Upgrading VVR on the Secondary
Follow these instructions to upgrade the Secondary hosts.

To upgrade the Secondary
1. Stop replication to the Secondary host by initiating a Primary pause using the following command:

   `# vradmin -g diskgroup pauserep local_rvgname`

2. Upgrade from VVR 4.1 or later to VVR 5.1 SP1 on the Secondary.

3. Resume the replication from the Primary using the following command:

   `# vradmin -g diskgroup resumerep local_rvgname sec_hostname`

Upgrading VVR on the Primary
After you upgrade the Secondary, use the Veritas product installer to upgrade the Primary.

Note: Reduce application downtime while upgrading by planning your upgrade.

See “Planning an upgrade from the previous VVR version” on page 197.
Migrating from SFHA to SFCFS or SFCFS HA 5.1 SP1

This chapter includes the following topics:

- Migrating from SFHA to SFCFS or SFCFS HA 5.1 SP1

Migrating from SFHA to SFCFS or SFCFS HA 5.1 SP1

This section describes how to migrate Storage Foundation High Availability (SFHA) 5.1 SP1 to Storage Foundation Cluster File System (SFCFS) or Storage Foundation Cluster File System High Availability (SFCFSHA) 5.1 SP1.

The product installer does not support direct upgrades from a previous version of SFHA to SFCFS or SFCFSHA 5.1 SP1. Ensure that you upgrade the existing SFHA to 5.1 SP1 before beginning this procedure.

To migrate from SFHA 5.1 SP1 to SFCFS 5.1 SP1 or SFCFS HA 5.1 SP1

1. Back up the existing SFHA main.cf file before beginning the upgrade.
2. Confirm that the storage disks are visible on all the nodes in the 5.1 SP1 SFHA cluster.
3. Bring all the failover service groups offline, using the following command:

    ```
    # hagrp -offline group_name -any
    ```

   The above command brings the service group offline on the node where the service group is currently online.
4. Unmount all the VxFS file systems which are not under VCS control. If the local file systems are under VCS control, then VCS unmounts the file systems when the failover service group is brought offline.

On the nodes that have any mounted VxFS local file systems that are not under VCS control:

```bash
# umount -F vxfs -a
```

5. Stop all the activity on the volumes and deport the local disk groups. If the local disk groups are part of VCS failover service groups, then VCS deports the disk groups when the failover service group is brought offline in step 3.

```bash
# vxvol -g dg_name stopall
# vxdg deport dg_name
```

6. Upgrade the existing SFHA to SFCFS or SFCFSHA 5.1 SP1:
   For SFCFS:
   ```bash
   # ./installsfcfs
   ```
   For SFCFS HA:
   ```bash
   # ./installsfcfsha
   ```

7. After installation is completed, reboot all the nodes.

8. After all nodes are rebooted, bring up CVM and the resources.

9. Verify that all SFHA processes have started. You can verify using the following commands:

   ```bash
   # gabconfig -a
   # hastatus -summ
   ```

10. Configure CVM and the resources:

    ```bash
    # /opt/VRTS/bin/cfscluster config
    ```

    This automatically detects the cluster configuration such as node-names, cluster name, and cluster=id and brings up CVM resources on all the nodes in the cluster.

    To verify:

    ```bash
    # gabconfig -a
    # hastatus -summ
    ```
11 Find out which node in the cluster, is the master node:

# /opt/VRTS/bin/vxclustadm nidmap

12 On the master node, import disk groups:

# vxdg -s import dg_name

This release supports certain commands to be executed from the slave node such as vxdg -s import dg_name.

See the *Storage Foundation Cluster File System Administrator's Guide* for more information.

13 Start all the volumes on the imported disk group, run the following command:

# vxvol -g dg_name name startall

14 To have the VxFS file system to be under VCS control, run the following command

# cfsmntadm add shared_diskgroup_name volume_name \ 
  mount_point all=cluster_mount_options

This command creates Parallel service groups in VCS comprising of the supplied parameters of Diskgroup, Volume & Mountpoint.

15 Mount the CFS file system on all the nodes in the cluster:

# cfsmount mount_point

16 On the CVM Master node, re-import all the required disk groups which must be in shared mode:

Import all other local disk groups which have not been imported in shared mode in step 12.

# vxdg -s import dg_name

17 Start all the volumes whose disk groups have been imported as shared. Use the following command:

# vxdg -g dg_name startall

18 Repeat steps 14 and 15 for any of the VxFS file systems which VCS needs to monitor through Failover service groups.
Post-upgrade tasks

This chapter includes the following topics:

- Configuring Powerfail Timeout after upgrade

Configuring Powerfail Timeout after upgrade

When you install SFCFS, SFCFS configures Powerfail Timeout (PFTO) using tunable parameters. Starting with SFCFS 5.0.1, the Powerfail Timeout (PFTO) has the following default values:

- disabled for devices using the HP-UX native multi-pathing
- enabled for devices using DMP

After installation, you can override the defaults, if required. You can explicitly enable or disable PFTO for native multi-pathing devices and DMP devices.

When you upgrade from SFCFS release 5.0 or earlier, SFCFS does not preserve any user-defined PFTO values. After the upgrade, the PFTO default values apply to all devices. If you want to use the device settings from the previous release, you must set the desired value explicitly. For example, in an SFCFS 5.0 installation, you have set the PFTO state to enabled for a native multi-pathing device. After you upgrade from SFCFS 5.0 to SFCFS 5.1SP1, the native device is set to the default value, which is disabled. In order to use PFTO, you must explicitly enable the PFTO on that device.

When you upgrade from SFCFS release 5.0.1 to a higher version, SFCFS preserves the PFTO state for the devices. After the upgrade, the PFTO values are set to the same values that the device had before the upgrade. For example, in an SFCFS 5.0.1 installation, you have set the PFTO state to enabled for a native multi-pathing device. After you upgrade from SFCFS 5.0.1 to SFCFS 5.1SP1, the native device is set to enabled.
For more information about controlling Powerfail Timeout, see the *Veritas Volume Manager Administrator's Guide*.
Verification of the installation or the upgrade

- Chapter 17. Verifying the Storage Foundation Cluster File System installation
Verifying the Storage Foundation Cluster File System installation

This chapter includes the following topics:

- Verifying that the products were installed
- Installation log files
- About enabling LDAP authentication for clusters that run in secure mode
- Starting and stopping processes for the Veritas products
- Checking Veritas Volume Manager processes
- Checking Veritas File System installation
- Verifying agent configuration for Storage Foundation Cluster File System
- Synchronizing time on Cluster File Systems
- Configuring VCS for Storage Foundation Cluster File System
- About the cluster UUID
- About the LLT and GAB configuration files
- Verifying the LLT, GAB, and VCS configuration files
- Verifying LLT, GAB, and cluster operation
Verifying that the products were installed

Verify that the SFCFS products are installed.

You can use the `swlist` command to check which depots have been installed:

```
# swlist -l product | grep VRTS
```

Use the following sections to further verify the product installation.

Installation log files

After every product installation, the installer creates three text files:

- Installation log file
- Response file
- Summary file

The name and location of each file is displayed at the end of a product installation, and are always located in the `/opt/VRTS/install/logs` directory. It is recommended that you keep the files for auditing, debugging, and future use.

Using the installation log file

The installation log file contains all commands executed during the procedure, their output, and errors generated by the commands. This file is for debugging installation problems and can be used for analysis by Veritas Support.

Using the summary file

The summary file contains the results of the installation by the installer or product installation scripts. The summary includes the list of the packages, and the status (success or failure) of each package. The summary also indicates which processes were stopped or restarted during the installation. After installation, refer to the summary file to determine whether any processes need to be started.

About enabling LDAP authentication for clusters that run in secure mode

Symantec Product Authentication Service (AT) supports LDAP (Lightweight Directory Access Protocol) user authentication through a plug-in for the
authentication broker. AT supports all common LDAP distributions such as Sun Directory Server, Netscape, OpenLDAP, and Windows Active Directory.

For a cluster that runs in secure mode, you must enable the LDAP authentication plug-in if the VCS users belong to an LDAP domain.

See “Enabling LDAP authentication for clusters that run in secure mode” on page 252.

If you have not already added VCS users during installation, you can add the users later.

See the Veritas Cluster Server Administrator's Guide for instructions to add VCS users.

Figure 17-1 depicts the SFCFS cluster communication with the LDAP servers when clusters run in secure mode.

Figure 17-1 Client communication with LDAP servers

1. When a user runs HA commands, AT initiates user authentication with the authentication broker.
2. Authentication broker on VCS node performs an LDAP bind operation with the LDAP directory.
3. Upon a successful LDAP bind, AT retrieves group information from the LDAP directory.
4. AT issues the credentials to the user to proceed with the command.

See the Symantec Product Authentication Service Administrator's Guide.

The LDAP schema and syntax for LDAP commands (such as, ldapadd, ldapmodify, and ldapsearch) vary based on your LDAP implementation.

Before adding the LDAP domain in Symantec Product Authentication Service, note the following information about your LDAP environment:
The type of LDAP schema used (the default is RFC 2307)
- UserObjectClass (the default is posixAccount)
- UserObject Attribute (the default is uid)
- User Group Attribute (the default is gidNumber)
- Group Object Class (the default is posixGroup)
- GroupObject Attribute (the default is cn)
- Group GID Attribute (the default is gidNumber)
- Group Membership Attribute (the default is memberUid)

URL to the LDAP Directory
- Distinguished name for the user container (for example, UserBaseDN=ou=people,dc=comp,dc=com)
- Distinguished name for the group container (for example, GroupBaseDN=ou=group,dc=comp,dc=com)

Enabling LDAP authentication for clusters that run in secure mode

The following procedure shows how to enable the plug-in module for LDAP authentication. This section provides examples for OpenLDAP and Windows Active Directory LDAP distributions.

Before you enable the LDAP authentication, complete the following steps:

- Make sure that the cluster runs in secure mode.

  # haclus -value SecureClus

  The output must return the value as 1.

- Make sure that the AT version is 5.0.32.0 or later.

  # /opt/VRTSat/bin/vssat showversion
  vssat version: 5.0.32.0

See the vssat.1m and the atldapconf.1m manual pages.
To enable OpenLDAP authentication for clusters that run in secure mode

1 Add the LDAP domain to the AT configuration using the vssat command.

The following example adds the LDAP domain, MYENTERPRISE:

```
# /opt/VRTSat/bin/vssat addldapdomain \
--domainname "MYENTERPRISE.symantecdomain.com"\ 
--server_url "ldap://my_openldap_host.symantecexample.com"\ 
--user_base_dn "ou=people,dc=symantecdomain,dc=myenterprise,dc=com"\ 
--user_attribute "cn" --user_object_class "account"\ 
--user_gid_attribute "gidNumber"\ 
--group_base_dn "ou=group,dc=symantecdomain,dc=myenterprise,dc=com"\ 
--group_attribute "cn" --group_object_class "posixGroup"\ 
--group_gid_attribute "member"\ 
--admin_user "cn=manager,dc=symantecdomain,dc=myenterprise,dc=com"\ 
--admin_user_password "password" --auth_type "FLAT"
```

2 Verify that you can successfully authenticate an LDAP user on the SFCFS nodes.

You must have a valid LDAP user ID and password to run the command. In the following example, authentication is verified for the MYENTERPRISE domain for the LDAP user, vcsadmin1.

```
galaxy# /opt/VRTSat/bin/vssat authenticate \
--domain ldap:MYENTERPRISE.symantecdomain.com \
--prplname vcsadmin1 --broker galaxy:2821
```

Enter password for vcsadmin1: ########################

```
authenticate
----------------------
----------------------
Authenticated User vcsadmin1
----------------------
```
3 Add the LDAP user to the main.cf file.

```bash
# haconf makerw
# hauser -add "CN=vcsadmin1/CN=people/
  DC=symantecdomain/DC=myenterprise/
  DC=com@myenterprise.symantecdomain.com" -priv Administrator
# haconf -dump -makero
```

If you want to enable group-level authentication, you must run the following command:

```bash
# hauser -addpriv \
ldap_group@ldap_domain AdministratorGroup
```

4 Verify that the main.cf file has the following lines:

```bash
# cat /etc/VRTSvcs/conf/config/main.cf
...
...
cluster clus1 {
  SecureClus = 1
  Administrators = {
    "CN=vcsadmin1/CN=people/DC=symantecdomain/DC=myenterprise/
     DC=com@myenterprise.symantecdomain.com"
  }
  AdministratorGroups = {
    "CN=symantecusergroups/DC=symantecdomain/DC=myenterprise/
     DC=com@myenterprise.symantecdomain.com "
  }
}
...
...
```

5 Set the VCS_DOMAIN and VCS_DOMAINTYPE environment variables as follows:

- VCS_DOMAIN=myenterprise.symantecdomain.com
- VCS_DOMAINTYPE=ldap

For example, for the Bourne Shell (sh or ksh), run the following commands:

```bash
# export VCS_DOMAIN=myenterprise.symantecdomain.com
# export VCS_DOMAINTYPE=ldap
```
6 Verify that you can log on to VCS. For example

```bash
# halogin vcsadmin1 password
# hasys -state
```

VCS NOTICE V-16-1-52563 VCS Login:vcsadmin1

#System   Attribute    Value
galaxy    Attribute    RUNNING
nebula    Attribute    RUNNING

Similarly, you can use the same LDAP user credentials to log on to the SFCFS node using the VCS Cluster Manager (Java Console).

7 To enable LDAP authentication on other nodes in the cluster, perform the procedure on each of the nodes in the cluster.
To enable Windows Active Directory authentication for clusters that run in secure mode

1. Run the LDAP configuration tool atldapconf using the -d option. The -d option discovers and retrieves an LDAP properties file which is a prioritized attribute list.

   ```bash
   # /opt/VRTSat/bin/atldapconf -d
   -s domain_controller_name_or_ipaddress
   -u domain_user -g domain_group
   ```

   For example:

   ```bash
   # /opt/VRTSat/bin/atldapconf -d -s 192.168.20.32 \
   -u Administrator -g "Domain Admins"
   ```

   Search User provided is invalid or Authentication is required to proceed further.
   Please provide authentication information for LDAP server.

   Username/Common Name: `symantecdomain\administrator`
   Password:

   Attribute file created.

2. Run the LDAP configuration tool atldapconf using the -c option. The -c option creates a CLI file to add the LDAP domain.

   ```bash
   # /opt/VRTSat/bin/atldapconf -c -d\n   windows_domain_name
   ```

   For example:

   ```bash
   # /opt/VRTSat/bin/atldapconf -c -d symantecdomain.com
   ```

   Attribute list file not provided, using default AttributeList.txt.
   CLI file name not provided, using default CLI.txt.

   CLI for addldapdomain generated.

3. Run the LDAP configuration tool atldapconf using the -x option. The -x option reads the CLI file and executes the commands to add a domain to the AT.

   ```bash
   # /opt/VRTSat/bin/atldapconf -x
   ```
4 List the LDAP domains to verify that the Windows Active Directory server integration is complete.

```bash
# /opt/VRTSat/bin/vssat listldapdomains

Domain Name : symantecdomain.com
Server URL : ldap://192.168.20.32:389
SSL Enabled : No
User Base DN : CN=people,DC=symantecdomain,DC=com
User Object Class : account
User Attribute : cn
User GID Attribute : gidNumber
Group Base DN : CN=group,DC=symantecdomain,DC=com
Group Object Class : group
Group Attribute : cn
Group GID Attribute : cn
Auth Type : FLAT
Admin User :
Admin User Password :
Search Scope : SUB
```

5 Set the VCS_DOMAIN and VCS_DOMAINTYPE environment variables as follows:

- VCS_DOMAIN=symantecdomain.com
- VCS_DOMAINTYPE=ldap

For example, for the Bourne Shell (sh or ksh), run the following commands:

```bash
# export VCS_DOMAIN=symantecdomain.com
# export VCS_DOMAINTYPE=ldap
```
6 Verify that you can log on to VCS. For example

```
# halogin vcsadmin1 password
# hasys -state
VCS NOTICE V-16-1-52563 VCS Login:vcsadmin1
#System Attribute Value
galaxy Attribute RUNNING
nebula Attribute RUNNING
```

Similarly, you can use the same LDAP user credentials to log on to the SFCFS node using the VCS Cluster Manager (Java Console).

7 To enable LDAP authentication on other nodes in the cluster, perform the procedure on each of the nodes in the cluster.

Starting and stopping processes for the Veritas products

After the installation and configuration is complete, the Veritas product installer starts the processes that are used by the installed products. You can use the product installer to stop or start the processes, if required.

To stop the processes

- Use the `-stop` option to stop the product installation script.
  
  For example, to stop the product's processes, enter the following command:

  ```
  # ./installer -stop
  ```

To start the processes

- Use the `-start` option to start the product installation script.
  
  For example, to start the product's processes, enter the following command:

  ```
  # ./installer -start
  ```

Checking Veritas Volume Manager processes

Use the following procedure to verify that Volume Manager processes are running.
To confirm that key Volume Manager processes are running

- Type the following command:

```bash
# ps -ef | grep vx
```

Entries for the `vxiod`, `vxconfigd`, `vxnotify`, `vxesd`, `vxrelocd`, `vxpal`, `vxcached`, `vxconfigbackupd`, and `vxsvc` processes should appear in the output from this command. If you disable hot-relocation, the `vxrelocd` and `vxnotify` processes are not displayed.

If you installed Storage Foundation and High Availability, the `vxodmd` and `vxdbd_11.31` processes are also displayed.

---

### Checking Veritas File System installation

The Veritas File System package consists of a kernel component and administrative commands.

#### Command installation verification

The Veritas File System commands are installed in the `/opt/VRTS/bin` directory. To verify, determine that the subdirectory is present:

```bash
# ls /opt/VRTS/bin
```

Make sure you have adjusted your environment variables accordingly.

---

### Verifying agent configuration for Storage Foundation Cluster File System

This section describes how to verify the agent configuration.
To verify the agent configuration

◆ Enter the cluster status command from any node in the cluster:

```
# cfscluster status
```

Output resembles:

```
Node               : system01
Cluster Manager    : running
CVM state          : running
No mount point registered with cluster configuration

Node               : system02
Cluster Manager    : running
CVM state          : running
No mount point registered with cluster configuration
```

Synchronizing time on Cluster File Systems

SFCFS requires that the system clocks on all nodes are synchronized using some external component such as the Network Time Protocol (NTP) daemon. If the nodes are not in sync, timestamps for change (ctime) and modification (mtime) may not be consistent with the sequence in which operations actually happened.

Configuring VCS for Storage Foundation Cluster File System

Configuring VCS means conveying to the VCS engine the definitions of the cluster, service groups, resources, and resource dependencies. VCS uses two configuration files in a default configuration:

■ The main.cf file defines the entire cluster.

■ The types.cf file defines the resource types.

By default, both files reside in the directory `/etc/VRTSvcs/conf/config`. Additional files similar to types.cf may be present if agents have been added, such as OracleTypes.cf.

In a VCS cluster, the first system to be brought online reads the configuration file and creates an internal (in-memory) representation of the configuration. Systems brought online after the first system derive their information from systems running in the cluster. You must stop the cluster while you are modifying the files.
from the command line. Changes made by editing the configuration files take effect when the cluster is restarted. The node on which the changes were made should be the first node to be brought back online.

**main.cf file**

The VCS configuration file `main.cf` is created during the installation procedure. After installation, the `main.cf` file contains the base definitions of the cluster and its nodes. Additionally, the file `types.cf` listed in the include statement defines the bundled agents for VCS resources.

See the *Veritas Cluster Server User's Guide*.

A typical VCS configuration file for SFCFS file resembles:

```plaintext
include "types.cf"
include "CFSTypes.cf"
include "CVMTypes.cf"
include "OracleASMTypes.cf"
include "Db2udbTypes.cf"
include "OracleTypes.cf"
include "SybaseTypes.cf"

cluster sfcfs_1 {
    HacliUserLevel = COMMANDROOT
}

system thor150 {
}

system thor151 {
}

group cvm {
    SystemList = { thor150 = 0, thor151 = 1 }  
    AutoFailOver = 0  
    Parallel = 1  
    AutoStartList = { thor150, thor151 }
}
CFSfsckd vxfsckd {
}

CVMCluster cvm_clus {
    CVMClustName = sfcfs_1
    CVMNodeId = { thor150 = 0, thor151 = 1 }
}
```
CVMTransport = gab
CVMTimeout = 200
)

CVMVxconfigd cvm_vxconfigd {
    Critical = 0
    CVMVxconfigdArgs = { syslog }
}

cvm_clus requires cvm_vxconfigd
vxfsckd requires cvm_clus

Storage Foundation Cluster File System HA Only
If you configured VCS Cluster Manager (Web Console), a service group, "ClusterService," was created that includes IP, Process, and Notifier resources. These resources were configured according to information you provided during the installation procedure. A resource dependency was also created.

Veritas Cluster Server application failover services
If you installed SFCFS HA, you can begin implementing the application monitoring failover services provided by the Veritas Cluster Server. Information about setting up VCS services is beyond the scope of this document.
See the Veritas Cluster Server documentation.

Configuring the cluster UUID when creating a cluster manually
You need to configure the cluster UUID when you manually create a cluster.
To configure the cluster UUID when you create a cluster manually

◆ On one node in the cluster, perform the following command to populate the cluster UUID on each node in the cluster.

```
# /opt/VRTSvcs/bin/uuidconfig.pl -clus -configure nodeA nodeB ... nodeN
```

Where nodeA, nodeB, through nodeN are the names of the cluster nodes.

About the cluster UUID

You can verify the existence of the cluster UUID.

To verify the cluster UUID exists

◆ From the prompt, run a more command.

```
cat /etc/vx/.uuids/cluuuid
```

About the LLT and GAB configuration files

Low Latency Transport (LLT) and Group Membership and Atomic Broadcast (GAB) are VCS communication services. LLT requires /etc/llthosts and /etc/llttab files. GAB requires /etc/gabtab file.

Table 17-1 lists the LLT configuration files and the information that these files contain.

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc/rc.config.d/lltconf</td>
<td>This file stores the start and stop environment variables for LLT:</td>
</tr>
<tr>
<td></td>
<td>■ LLT_START—Defines the startup behavior for the LLT module after a system reboot. Valid values include:</td>
</tr>
<tr>
<td></td>
<td>1—Indicates that LLT is enabled to start up.</td>
</tr>
<tr>
<td></td>
<td>0—Indicates that LLT is disabled to start up.</td>
</tr>
<tr>
<td></td>
<td>■ LLT_STOP—Defines the shutdown behavior for the LLT module during a system shutdown. Valid values include:</td>
</tr>
<tr>
<td></td>
<td>1—Indicates that LLT is enabled to shut down.</td>
</tr>
<tr>
<td></td>
<td>0—Indicates that LLT is disabled to shut down.</td>
</tr>
</tbody>
</table>

The installer sets the value of these variables to 1 at the end of Storage Foundation Cluster File System configuration.
### Table 17-1  LLT configuration files (continued)

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
</table>
| /etc/llthosts | The file `llthosts` is a database that contains one entry per system. This file links the LLT system ID (in the first column) with the LLT host name. This file must be identical on each node in the cluster. A mismatch of the contents of the file can cause indeterminate behavior in the cluster.  
For example, the file `/etc/llthosts` contains the entries that resemble:  

```plaintext
0    galaxy  
1    nebula
```

| /etc/llttab | The file `llttab` contains the information that is derived during installation and used by the utility `lltconfig(1M)`. After installation, this file lists the LLT network links that correspond to the specific system.  
For example, the file `/etc/llttab` contains the entries that resemble:  

```plaintext
set-node galaxy  
set-cluster 2  
link lan1 /dev/lan:1 - ether - -  
link lan2 /dev/lan:2 - ether - -  
```

The first line identifies the system. The second line identifies the cluster (that is, the cluster ID you entered during installation). The next two lines begin with the `link` command. These lines identify the two network cards that the LLT protocol uses.  

If you configured a low priority link under LLT, the file also includes a "link-lowpri" line.  

Refer to the `llttab(4)` manual page for details about how the LLT configuration may be modified. The manual page describes the ordering of the directives in the `llttab` file.  

---

**Table 17-2** lists the GAB configuration files and the information that these files contain.
Table 17-2  GAB configuration files

<table>
<thead>
<tr>
<th>File</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/etc/rc.config.d/gabconf</td>
<td>This file stores the start and stop environment variables for GAB:</td>
</tr>
<tr>
<td></td>
<td>■ <strong>GAB_START</strong>—Defines the startup behavior for the GAB module after a system reboot. Valid values include:</td>
</tr>
<tr>
<td></td>
<td>1—Indicates that GAB is enabled to start up.</td>
</tr>
<tr>
<td></td>
<td>0—Indicates that GAB is disabled to start up.</td>
</tr>
<tr>
<td></td>
<td>■ <strong>GAB_STOP</strong>—Defines the shutdown behavior for the GAB module during a system shutdown. Valid values include:</td>
</tr>
<tr>
<td></td>
<td>1—Indicates that GAB is enabled to shut down.</td>
</tr>
<tr>
<td></td>
<td>0—Indicates that GAB is disabled to shut down.</td>
</tr>
<tr>
<td></td>
<td>The installer sets the value of these variables to 1 at the end of Storage Foundation Cluster File System configuration.</td>
</tr>
<tr>
<td>/etc/gabtab</td>
<td>After you install SFCFS, the file /etc/gabtab contains a <code>gabconfig(1)</code> command that configures the GAB driver for use.</td>
</tr>
<tr>
<td></td>
<td>The file <code>/etc/gabtab</code> contains a line that resembles:</td>
</tr>
<tr>
<td></td>
<td><code>/sbin/gabconfig -c -nN</code></td>
</tr>
<tr>
<td></td>
<td>The <code>-c</code> option configures the driver for use. The <code>-nN</code> specifies that the cluster is not formed until at least N nodes are ready to form the cluster. Symantec recommends that you set N to be the total number of nodes in the cluster.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Symantec does not recommend the use of the <code>-c -x</code> option for <code>/sbin/gabconfig</code>. Using <code>-c -x</code> can lead to a split-brain condition.</td>
</tr>
</tbody>
</table>

Verifying the LLT, GAB, and VCS configuration files

Make sure that the LLT, GAB, and VCS configuration files contain the information you provided during VCS installation and configuration.

**To verify the LLT, GAB, and VCS configuration files**

1. Navigate to the location of the configuration files:
   - **LLT**
     - `/etc/llthosts`
     - `/etc/llttab`
   - **GAB**
     - `/etc/gabtab`
Verifying LLT, GAB, and cluster operation

Verify the operation of LLT, GAB, and the cluster using the VCS commands.

To verify LLT, GAB, and cluster operation

1. Log in to any node in the cluster as superuser.
2. Make sure that the PATH environment variable is set to run the VCS commands.
3. Verify LLT operation.
   See “Verifying LLT” on page 266.
4. Verify GAB operation.
   See “Verifying GAB” on page 268.
5. Verify the cluster operation.
   See “Verifying the cluster” on page 270.

Verifying LLT

Use the `lltstat` command to verify that links are active for LLT. If LLT is configured correctly, this command shows all the nodes in the cluster. The command also returns information about the links for LLT for the node on which you typed the command.

Refer to the `lltstat(1M)` manual page for more information.

To verify LLT

1. Log in as superuser on the node `galaxy`.
2. Run the `lltstat` command on the node `galaxy` to view the status of LLT.

```
lltstat -n
```

The output on `galaxy` resembles:

```
LLT node information:
  Node    State    Links
```
Each node has two links and each node is in the OPEN state. The asterisk (*)
denotes the node on which you typed the command.

If LLT does not operate, the command does not return any LLT links
information: If only one network is connected, the command returns the
following LLT statistics information:

```
LLT node information:
   Node     State  Links
* 0 galaxy OPEN 2
1 nebula  OPEN 2
2 saturn  OPEN 1
```

3 Log in as superuser on the node nebula.

4 Run the `lltstat -n` command on the node nebula to view the status of LLT.

```
lltstat -n
```

The output on nebula resembles:

```
LLT node information:
   Node     State  Links
  0 galaxy OPEN 2
*1 nebula OPEN 2
```

5 To view additional information about LLT, run the `lltstat -nvv` command
on each node.

For example, run the following command on the node galaxy in a two-node
cluster:

```
lltstat -nvv active
```

The output on galaxy resembles:

```
   Node     State Link  Status   Address
* 0 galaxy OPEN lan1 UP  08:00:20:93:0E:34
         lan2 UP  08:00:20:93:0E:38
1 nebula  OPEN lan1 UP  08:00:20:8F:D1:F2
         lan2 DOWN
```
The command reports the status on the two active nodes in the cluster, galaxy and nebula.

For each correctly configured node, the information must show the following:

- A state of OPEN
- A status for each link of UP
- A MAC address for each link

However, the output in the example shows different details for the node nebula. The private network connection is possibly broken or the information in the /etc/llttab file may be incorrect.

6 To obtain information about the ports open for LLT, type `lltstat -p` on any node.

For example, type `lltstat -p` on the node galaxy in a two-node cluster:

```
lltstat -p
```

The output resembles:

```
LLT port information:
    Port  Usage  Cookie
    0     gab    0x0
          opens: 0 2 3 4 5 6 7 8 9 10 11 ... 60 61 62 63
          connects: 0 1
    7     gab    0x7
          opens: 0 2 3 4 5 6 7 8 9 10 11 ... 60 61 62 63
          connects: 0 1
    31    gab    0x1F
          opens: 0 2 3 4 5 6 7 8 9 10 11 ... 60 61 62 63
          connects: 0 1
```

**Verifying GAB**

Verify the GAB operation using the `gabconfig -a` command. This command returns the GAB port membership information.

The ports indicate the following:

- **a** GAB
- **b** I/O fencing
- **d** Oracle Disk Manager (ODM)
Cluster File System (CFS)
Veritas Cluster Server (VCS: High Availability Daemon)
Cluster Volume Manager (CVM)
(to ship commands from slave node to master node)
Port u in the `gabconfig` output is visible with CVM protocol version >= 100.
Cluster Volume Manager (CVM)
vxconfigd (module for CVM)

For more information on GAB, refer to the *Veritas Cluster Server Administrator's Guide*.

To verify GAB

1. To verify that GAB operates, type the following command on each node:

   `/sbin/gabconfig -a`

2. Review the output of the command:
   - If GAB operates, the following GAB port membership information is returned:

     ```
     GAB Port Memberships
     ====================================
     Port a gen ada401 membership 01
     Port b gen ada40d membership 01
     Port d gen ada409 membership 01
     Port f gen ada41c membership 01
     Port h gen ada40f membership 01
     Port u gen ada41a membership 01
     Port v gen ada416 membership 01
     Port w gen ada418 membership 01
     ```

   Note that port b in the `gabconfig` command output may not indicate that I/O fencing feature is configured. After you configure Storage Foundation Cluster File System using the installer, the installer starts I/O fencing in disabled mode. You can use the `vxfenadm -d` command to verify the I/O fencing configuration.
If GAB does not operate, the command does not return any GAB port membership information:

GAB Port Memberships
============================================================================

Verifying the cluster

Verify the status of the cluster using the `hastatus` command. This command returns the system state and the group state.

Refer to the `hastatus(1M)` manual page.

Refer to the *Veritas Cluster Server Administrator's Guide* for a description of system states and the transitions between them.

To verify the cluster

1. To verify the status of the cluster, type the following command:

   ```
   hastatus -summary
   ```

   The output resembles:

   ```
   -- SYSTEM STATE
   -- System       State       Frozen
   A  galaxy      RUNNING      0
   A  nebula      RUNNING      0

   -- GROUP STATE
   -- Group       System     Probed AutoDisabled     State
   B  cvm         galaxy  Y   N       ONLINE
   B  cvm         nebula  Y   N       ONLINE
   B  VxSS        galaxy  Y   N       ONLINE
   B  VxSS        nebula  Y   N       ONLINE
   ```

   Note that the VxSS service group is displayed only if you have configured the cluster in secure mode.

2. Review the command output for the following information:

   - The system state
     
     If the value of the system state is RUNNING, the cluster is successfully started.
Verifying the cluster nodes

Verify the information of the cluster systems using the `hasys -display` command. The information for each node in the output should be similar.

Refer to the `hasys(1M)` manual page.

Refer to the *Veritas Cluster Server Administrator’s Guide* for information about the system attributes for VCS.

To verify the cluster nodes

- On one of the nodes, type the `hasys -display` command:

```
hasys -display
```

The example shows the output when the command is run on the node `galaxy`. The list continues with similar information for `nebula` (not shown) and any other nodes in the cluster.

Verifying the Storage Foundation Cluster File System installation

Verifying LLT, GAB, and cluster operation
Adding and removing nodes

- Chapter 18. Adding a node to a cluster
- Chapter 19. Removing a node from Storage Foundation Cluster File System clusters
Adding a node to a cluster

This chapter includes the following topics:

■ About adding a node to a cluster
■ Before adding a node to a cluster
■ Preparing to add a node to a cluster
■ Adding a node to a cluster
■ Configuring server-based fencing on the new node
■ Updating the Storage Foundation for Databases (SFDB) repository after adding a node

About adding a node to a cluster

After you install SFCFS and create a cluster, you can add and remove nodes from the cluster. You can create clusters of up to 64 nodes.

You can add a node:

■ Using the product installer
■ Using the Web installer
■ Manually

The example procedures describe how to add a node to an existing cluster with two nodes.

Before adding a node to a cluster

Before preparing to add the node to an existing SFCFS cluster, verify the following:
Hardware and software requirements are met.  
See “Meeting hardware and software requirements” on page 278.

Hardware is set up for the new node.  
See “Setting up the hardware” on page 278.

The existing cluster is an SFCFS cluster and that SFCFS is running on the cluster.

The new system has the same identical operating system versions and patch levels as that of the existing cluster.

Meeting hardware and software requirements

The system you add to the cluster must meet the hardware and software requirements.

See “Assessing system preparedness” on page 30.

If the cluster is upgraded from the previous SFCFS version, you must check the cluster protocol version to make sure it has the same version as the node to be added. If there is a protocol mismatch, the node is unable to join the existing cluster.

To verify there is no protocol version mismatch between the cluster and the new node

- Check the cluster protocol version using:

  # vxdctl list |grep protocol

On the master node, check the upgrade protocol using:

  # vxdctl upgrade

Setting up the hardware

Figure 18-1 shows that before you configure a new system on an existing cluster, you must physically add the system to the cluster.
To set up the hardware

1. Connect the SFCFS private Ethernet controllers.

   Perform the following tasks as necessary:
   - When you add nodes to a cluster, use independent switches or hubs for the private network connections. You can only use crossover cables for a cluster, so you might have to swap out the cable for a switch or hub.
   - If you already use independent hubs, connect the two Ethernet controllers on the new node to the independent hubs.

   Figure 18-1 illustrates a new node being added to an existing two-node cluster using two independent hubs.

2. Make sure that you meet the following requirements:
   - The node must be connected to the same shared storage devices as the existing nodes.
   - The node must have private network connections to two independent switches for the cluster.

   For more information, see the *Veritas Cluster Server Installation Guide*. 
The network interface names used for the private interconnects on the new node must be the same as that of the existing nodes in the cluster.

Preparing to add a node to a cluster

Complete the following preparatory steps on the new node before you add the node to an existing SFCFS cluster.

To prepare the new node

1. Verify that the new node meets installation requirements.
   
   ```
   # ./installsfcs -precheck saturn
   ```

2. Install SFCFS on the new system.

   Note: Use the `-install` option to install SFCFS. Do not configure SFCFS after the installation.

   Would you like to configure SFCFS on saturn [y, n, q] (n)

   You can configure the new node later using the configuration from the existing cluster nodes.

   See “About installation and configuration methods” on page 28.

Adding a node to a cluster

You can use one of the following methods to add a node to an existing SFCFS cluster:

- **SFCFS installer**
  
  See “Adding a node to a cluster using the SFCFS installer” on page 281.

  See “Adding a node using the Web-based installer” on page 284.

- **Manual**
  
  See “Adding the node to a cluster manually” on page 285.

Note: Before you add the node, make sure that SFCFS is not configured on the node.
Adding a node to a cluster using the SFCFS installer

You can add a node using the `--addnode` option with the SFCFS installer.

The SFCFS installer performs the following tasks:

- Verifies that the node and the existing cluster meet communication
  requirements.
- Verifies the products and packages installed on the new node.
- Discovers the network interfaces on the new node and checks the interface
  settings.
- Creates the following files on the new node:
  
  `/etc/llttab`
  `/etc/VRTSvcs/conf/sysname`
- Updates the following configuration files and copies them on the new node:
  
  `/etc/llthosts`
  `/etc/gabtab`
  `/etc/VRTSvcs/conf/config/main.cf`
- Copies the following files from the existing cluster to the new node:
  
  `/etc/vxfenmode`
  `/etc/vxfendg`
  `/etc/vx/.uuids/clusuuid`
- Configures security on the new node if the existing cluster is a secure cluster.

---

**Warning:** If the root broker system has failed, then you must recover or
reconfigure the root broker system before you add a new node to the cluster.

---

- Configures disk-based or server-based fencing depending on the fencing mode
  in use on the existing cluster.
- Adds the new node to the CVM, ClusterService, and VxSS service groups in
  the VCS configuration.

---

**Note:** For other service groups configured under VCS, update the configuration
for the new node manually.

---

- Starts SFCFS processes and configures CVM and CFS on the new node.

At the end of the process, the new node joins the SFCFS cluster.
Note: If you have configured server-based fencing on the existing cluster, make sure that the CP server does not contain entries for the new node. If the CP server already contains entries for the new node, remove these entries before adding the node to the cluster, otherwise the process may fail with an error.

To add the node to an existing cluster using the installer

1. Log in as the root user on one of the nodes of the existing cluster.
2. Run the SFCFS installer with the -addnode option.
   
   ```bash
   # cd /opt/VRTS/install
   # ./installsfcs -addnode
   ```
   
The installer displays the copyright message and the location where it stores the temporary installation logs.
3. Enter the name of a node in the existing SFCFS cluster. The installer uses the node information to identify the existing cluster.
   
   Enter a node name in the SFCFS cluster to which you want to add a node: **galaxy**
4. Review and confirm the cluster information.
5. Enter the name of the systems that you want to add as new nodes to the cluster.
   
   Enter the system names separated by spaces to add to the cluster: **saturn**
   
The installer checks the installed products and packages on the nodes and discovers the network interfaces.
6. Enter the name of the network interface that you want to configure as the first private heartbeat link.

   **Note:** The network interface names used for the private interconnects on the new node must be the same as that of the existing nodes in the cluster. The LLT configuration for the new node must be the same as that of the existing cluster.

   Enter the NIC for the first private heartbeat link on satwn: **[b,q,?] lan1**
7 Enter y to configure a second private heartbeat link.

**Note:** At least two private heartbeat links must be configured for high availability of the cluster.

Would you like to configure a second private heartbeat link? [y,n,q,b,?] (y)

8 Enter the name of the network interface that you want to configure as the second private heartbeat link.

Enter the NIC for the second private heartbeat link on saturn: [b,q,?] lan2

9 Depending on the number of LLT links configured in the existing cluster, configure additional private heartbeat links for the new node.

The installer verifies the network interface settings and displays the information.

10 Review and confirm the information.

11 If you have configured SMTP, SNMP, or the global cluster option in the existing cluster, you are prompted for the NIC information for the new node.

Enter the NIC for VCS to use on saturn: lan3

12 The installer prompts you with an option to mount the shared volumes on the new node. Select y to mount them.

When completed, the installer confirms the volumes are mounted and indicates the location of the log file with details of the actions performed.
13 If the existing cluster uses server-based fencing in secure mode, provide responses to the following installer prompts.

If you are using different root brokers for the CP server and the client SFCFS cluster, enter y to confirm the use of different root brokers. The installer attempts to establish trust between the new node being added to the cluster and the authentication broker of the CP server.

Are you using different Root Brokers for the CP Server(s) and the client cluster? (If so then installer will try to establish trust between the new node(s) being added and CP Server's Authentication Broker) [y,n,q] (n) y

Enter the host name of the authentication broker used for any one of the CP servers.

Enter hostname of the Authentication Broker being used for any one of the CP Server(s): [b] mycps1.symantecexample.com

Enter the port number where the authentication broker for the CP server listens to establish trust with the new node:

Enter the port where the Authentication Broker mycps1.symantecexample.com for the CP Server(s) is listening for establishing trust: [b] (2821)

The installer then starts all the required Veritas processes and joins the new node to cluster.

**Note:** Do not quit the installer if you want to perform the Oracle pre-installation tasks using the SFCFS installer.

14 Confirm using lltstat -n and gabconfig -a.

Adding a node using the Web-based installer

You can use the Web-based installer to add a node to a cluster.
**To add a node to a cluster using the Web-based installer**

1. From the Task pull-down menu, select Add a Cluster node.
   From the product pull-down menu, select the product.
   Click the Next button.

2. In the System Names field enter a name of a node in the cluster where you plan to add the node.
   The installer program checks inter-system communications and compatibility.
   If the node fails any of the checks, review the error and fix the issue.
   If prompted, review the cluster's name, ID, and its systems. Click the Yes button to proceed.

3. In the System Names field, enter the names of the systems that you want to add to the cluster as nodes. Separate system names with spaces. Click the Validate button to check if the system can work in the cluster.
   The installer program checks inter-system communications and compatibility.
   If the system fails any of the checks, review the error and fix the issue.
   Click the Next button. If prompted, click the Yes button to add the system and to proceed.

4. From the heartbeat NIC pull-down menus, select the heartbeat NICs for the cluster. Click the Next button.

5. Once the addition is complete, review the log files. Optionally send installation information to Symantec. Click the Finish button to complete the node's addition to the cluster.

**Adding the node to a cluster manually**

Perform this procedure after you install SFCFS only if you plan to add the node to the cluster manually.

**To add the node manually to the cluster**

1. Start the Volume Manager.
   See “Starting Volume Manager on the new node” on page 286.

2. Configure LLT and GAB.
   See “Configuring LLT and GAB on the new node” on page 286.

3. If the existing cluster is a secure cluster, set up the new node to run in secure mode.
   See “Setting up the node to run in secure mode” on page 288.
4 If the existing cluster is configured to use server-based I/O fencing, configure server-based I/O fencing on the new node.

See “Starting fencing on the new node” on page 291.

5 Start VCS.

See “To start VCS on the new node” on page 292.

6 Configure CVM and CFS.

See “Configuring CVM and CFS on the new node” on page 292.

7 If the ClusterService group is configured on the existing cluster, add the node to the group.

See “Configuring the ClusterService group for the new node” on page 293.

Starting Volume Manager on the new node

Volume Manager uses license keys to control access. As you run the vxinstall utility, answer n to prompts about licensing. You installed the appropriate license when you ran the installsfcfs program.

To start Volume Manager on the new node

1 To start Veritas Volume Manager on the new node, use the vxinstall utility:

   # vxinstall

2 VxVM uses license keys to control access. As you run the utility, answer "n" when prompted about licensing; you installed the appropriate license when you ran the installsfcfs utility.

3 Enter n when prompted to set up a system wide disk group for the system. The installation completes.

4 Verify that the daemons are up and running. Enter the command:

   # vxdisk list

   Make sure the output displays the shared disks without errors.

Configuring LLT and GAB on the new node

Perform the steps in the following procedure to configure LLT and GAB on the new node.
To configure LLT and GAB on the new node

1. Edit the `/etc/llthosts` file on the existing nodes. Using vi or another text editor, add the line for the new node to the file. The file resembles:

```
0 galaxy
1 nebula
2 saturn
```

2. Copy the `/etc/llthosts` file from one of the existing systems over to the new system. The `/etc/llthosts` file must be identical on all nodes in the cluster.

3. Create an `/etc/llttab` file on the new system. For example:

```
set-node saturn
set-cluster 101

link lan1 /dev/lan:1 - ether --
link lan2 /dev/lan:2 - ether --
```

Except for the first line that refers to the node, the file resembles the `/etc/llttab` files on the existing nodes. The second line, the cluster ID, must be the same as in the existing nodes.

4. Use vi or another text editor to create the file `/etc/gabtab` on the new node. This file must contain a line that resembles the following example:

```
/sbin/gabconfig -c -nN
```

Where N represents the number of systems in the cluster. For a three-system cluster, N would equal 3.

5. Edit the `/etc/gabtab` file on each of the existing systems, changing the content to match the file on the new system.

6. Use vi or another text editor to create the file `/etc/VRTSvcs/conf/sysname` on the new node. This file must contain the name of the new node added to the cluster.

For example:

```
saturn
```
7. Create the Unique Universal Identifier file `/etc/vx/uuids/clusuuid` on the new node:

```bash
# uuidconfig.pl -remsh -clus -copy -from_sys galaxy -to_sys saturn
```

8. Start the LLT, GAB, and ODM drivers on the new node:

```bash
# /sbin/init.d/llt start
# /sbin/init.d/gab start
# /sbin/init.d/vxfen start
# kcmodule vxgms=loaded
# kcmodule odm=loaded
# /sbin/init.d/odm stop
# /sbin/init.d/odm start
```

9. On the new node, verify that the GAB port memberships are a and d:

```bash
# gabconfig -a
GAB Port Memberships
===================================
Port a gen df204 membership 012
Port d gen df207 membership 012
```

### Setting up the node to run in secure mode

You must follow this procedure only if you are adding a node to a cluster that is running in secure mode. If you are adding a node to a cluster that is not running in a secure mode, proceed with configuring LLT and GAB.

Table 18-1 uses the following information for the following command examples.

<table>
<thead>
<tr>
<th>Name</th>
<th>Fully-qualified host name (FQHN)</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>saturn</td>
<td>saturn.nodes.example.com</td>
<td>The new node that you are adding to the cluster.</td>
</tr>
</tbody>
</table>
Table 18-1  The command examples definitions (continued)

<table>
<thead>
<tr>
<th>Name</th>
<th>Fully-qualified host name (FQHN)</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>RB1</td>
<td>RB1.brokers.example.com</td>
<td>The root broker for the cluster</td>
</tr>
<tr>
<td>RB2</td>
<td>RB2.brokers.example.com</td>
<td>Another root broker, not the cluster's RB</td>
</tr>
</tbody>
</table>

To verify the existing security setup on the node

1. If node saturn is configured as an authentication broker (AB) belonging to a root broker, perform the following steps. Else, proceed to configuring the authentication broker on node saturn.

2. Find out the root broker to which the node saturn belongs using the following command.

   ```
   # vssregctl -l -q -b "Security\Authentication\Authentication Broker" -k "BrokerName"
   ```

3. If the node saturn already belongs to root broker RB1, it is configured as part of the cluster. Proceed to setting up VCS related security configuration.

4. If the node saturn belongs to a different root broker (for example RB2), perform the following steps to remove the security credentials from node saturn.
   - Kill `/opt/VRTSat/bin/vxatd` process.
   - Remove the credential that RB2 has given to AB on node saturn.

     ```
     # vssat deletecred --domain type:domainname --prplname prplname
     ```

     For example:

     ```
     # vssat deletecred --domain vx:root@RB2.brokers.example.com --prplname saturn.nodes.example.com
     ```

Configuring the authentication broker on node saturn

Configure a new authentication broker (AB) on node saturn. This AB belongs to root broker RB1.
To configure the authentication broker on node saturn

1. Create a principal for node saturn on root broker RB1. Execute the following command on root broker RB1.

```
# vssat addprpl --pdrtype root --domain domainname \
  --prplname prplname --password password \
  --prpltype service
```

For example:

```
# vssat addprpl --pdrtype root \
  --domain root@RB1.brokers.example.com \
  --prplname saturn.nodes.example.com \
  --password flurbdicate --prpltype service
```

2. Ensure that there is no clock skew between the times on node saturn and RB1.

3. Copy the `/opt/VRTSat/bin/root_hash` file from RB1 to node saturn.

4. Configure AB on node saturn to talk to RB1.

```
# vxatd -o -a -n prplname -p password -x vx -y domainname -q \n  rootbroker -z 2821 -h roothash_file_path
```

For example:

```
# vxatd -o -a -n saturn.nodes.example.com -p flurbdicate \ 
  -x vx -y root@RB1.brokers.example.com -q RB1 \ 
  -z 2821 -h roothash_file_path
```

5. Verify that AB is configured properly.

```
# vssat showbrokermode
```

The command should return 1, indicating the mode to be AB.

Setting up SFCFS related security configuration

Perform the following steps to configure SFCFS related security settings.

1. Start `/opt/VRTSat/bin/vxatd` process.

2. Create HA_SERVICES domain for SFCFS.

```
# vssat createpd --pdrtype ab --domain HA_SERVICES
```
3  Add SFCFS and webserver principal to AB on node saturn.

    # vssat addprpl --pdrtype ab --domain HA_SERVICES --prplname webserver_VCS_prplname --password new_password --prpltype service --can_proxy

4  Create /etc/VRTSvcs/conf/config/.secure file.

    # touch /etc/VRTSvcs/conf/config/.secure

Starting fencing on the new node

Perform the following steps to start fencing on the new node.

To start fencing on the new node

1  If you are using disk-based fencing on at least one node, copy the following files from one of the nodes in the existing cluster to the new node:

    /etc/default/vxfen
    /etc/vxfendg
    /etc/vxenmode

   If you are using pure CP server-based fencing on the existing cluster, then only the /etc/vxenmode file needs to be copied on the new node.

2  Start fencing on the new node:

3  On the new node, verify that the GAB port memberships are a, b, and d:

    # gabconfig -a

    GAB Port Memberships
    ==============================================================
    Port a gen   df204 membership 012
    Port b gen   df20d membership 012
    Port d gen   df20a membership 012

After adding the new node

Start VCS on the new node.
To start VCS on the new node

1. Start VCS on the new node:

   # hastart

   VCS brings the CVM and CFS groups online.

2. Verify that the CVM and CFS groups are online:

   # hagrp -state

Configuring CVM and CFS on the new node

Modify the existing cluster configuration to configure CVM and CFS for the new node.

To configure CVM and CFS on the new node

1. Make a backup copy of the main.cf file on the existing node, if not backed up in previous procedures. For example:

   # cd /etcVRTSvcs/conf/config
   # cp main.cf main.cf.2node

2. On one of the nodes in the existing cluster, set the cluster configuration to read-write mode:

   # haconf -makerw

3. Add the new node to the VCS configuration, if not already added:

   # hasys -add saturn

4. To enable the existing cluster to recognize the new node, run the following commands on one of the existing nodes:

   # hagrp -modify cvm SystemList -add saturn 2
   # hagrp -modify cvm AutoStartList -add saturn
   # hares -modify cvm_clus CVMNodeId -add saturn 2
   # haconf -dump -makero
   # /etc/vx/bin/vxclustadm -m vcs reinit
   # /etc/vx/bin/vxclustadm nidmap
On the remaining nodes of the existing cluster, run the following commands:

```
# /etc/vx/bin/vxclustadm -m vcs reinit
# /etc/vx/bin/vxclustadm nidmap
```

Copy the configuration files from one of the nodes in the existing cluster to the new node:

```
# rcp /etc/VRTSvcs/conf/config/main.cf \\
saturn:/etc/VRTSvcs/conf/config/main.cf
# rcp /etc/VRTSvcs/conf/config/CFSTypes.cf \\
saturn:/etc/VRTSvcs/conf/config/CFSTypes.cf
# rcp /etc/VRTSvcs/conf/config/CVMTypes.cf \\
saturn:/etc/VRTSvcs/conf/config/CVMTypes.cf
```

**Configuring the ClusterService group for the new node**

If the ClusterService group is configured on the existing cluster, add the node to the group by performing the steps in the following procedure on one of the nodes in the existing cluster.

**To configure the ClusterService group for the new node**

1. On an existing node, for example galaxy, write-enable the configuration:

```
# haconf -makerw
```

2. Add the node saturn to the existing ClusterService group.

```
# hagrp -modify ClusterService SystemList -add saturn 2
# hagrp -modify ClusterService AutoStartList -add saturn
```

3. Modify the IP address and NIC resource in the existing group for the new node.

```
# hares -modify gcoip Device lan0 -sys saturn
# hares -modify gconic Device lan0 -sys saturn
```

4. Save the configuration by running the following command from any node.

```
# haconf -dump -makero
```
Configuring server-based fencing on the new node

Perform this step if your existing cluster uses server-based I/O fencing.

To configure server-based fencing on the new node

1. Log in to each CP server as the root user.
2. Update each CP server configuration with the new node information:

   ```
   # /opt/VRTScps/bin/cpsadm -s thunderbolt \
   -a add_node -c clus1 -u {f0735332-1dd1-11b2} -h saturn -n2
   Node 2 (saturn) successfully added
   ```

3. Verify that the new node is added to the CP server configuration:

   ```
   # /opt/VRTScps/bin/cpsadm -s thunderbolt -a list_nodes
   ``

   The new node must be listed in the output.

4. Add the VCS user `cpsclient@saturn` to each CP server:

   ```
   # /opt/VRTScps/bin/cpsadm -s thunderbolt \
   -a add_user -e cpsclient@saturn \ 
   -f cps_operator -g vx
   User cpsclient@saturn successfully added
   ```

To configure server-based fencing with security on the new node

1. As the root user, create the VCS user and the domain on the new node:

   ■ Create a dummy configuration file `/etc/VRTSvcs/conf/config/main.cf` that resembles the following example:

   ```
   # cat main.cf
   include "types.cf"
   cluster clus1 {
       SecureClus = 1
   }
   system saturn {
   }
   ```

   ■ Start VCS in one node mode on the new node:
Adding a node to a cluster

Configuring server-based fencing on the new node

# /opt/VRTSvcs/bin/hastart -onenode

2 Verify that the VCS user and the domain are created on the new node:

# /opt/VRTScps/bin/cpsat showcred | grep _HA_VCS_
# /opt/VRTScps/bin/cpsat listpd -t local | grep HA_SERVICES

3 Stop VCS if the VCS user and domain are created successfully on the new node:

# /opt/VRTSvcs/bin/hastop

4 If the root broker for the CP server and the new node are different, run the following command to establish trust between the authentication broker of the CP Server and the new node:

# /usr/bin/echo y | /opt/VRTScps/bin/cpsat setuptrust -b thunderbolt -s high

5 Log in to each CP server as the root user.

6 Update each CP server configuration with the new node information:

# /opt/VRTScps/bin/cpsadm -s thunderbolt -a add_node -c clus1 -u {f0735332-1dd1-11b2} -h saturn -n2
Node 2 (saturn) successfully added

7 Verify that the new node is added to the CP server configuration:

# /opt/VRTScps/bin/cpsadm -s thunderbolt -a list_nodes
The new node must be listed in the output.

8 Add the VCS user _HA_VCS_saturn@HA_SERVICES@saturn.veritas.com to each CP server:

# /opt/VRTScps/bin/cpsadm -s thunderbolt -a add_user -e _HA_VCS_saturn@HA_SERVICES@saturn.veritas.com -f cps_operator -g vx
User _HA_VCS_saturn@HA_SERVICES@saturn.veritas.com successfully added
Updating the Storage Foundation for Databases (SFDB) repository after adding a node

If you are using Database Checkpoints, Database Flashsnap, or Adding a Node in your configuration, update the SFDB repository to enable access for the new node after it is added to the cluster.

To update the SFDB repository after adding a node

1. Run the following to change permission, owner, group of various SFDB directories on the newly added node:

   ```
   # sfua_db_config
   ```

2. Run the `dbed_update` command on any one node in the cluster. For example:

   ```
   $ dbed_update -S $ORACLE_SID -H $ORACLE_HOME -G $ORACLE_SERVICE_GROUP
   ```

This completes the addition of the node to the SFDB repository.

For information on using SFDB tools features:

See the Storage Foundation guide: *Storage Foundation: Storage and Availability Management for Oracle Databases.*
About removing a node from a cluster

You can remove one or more nodes from an SFCFS cluster if the node no longer needs to be part of the cluster.

Removing a node from a cluster requires:

- Stopping applications that use File System or Cluster File System mount points not configured under VCS.
- Stopping VCS on the node to be removed.
Removing a node from a cluster

Perform the following steps to remove a node from a cluster. The procedure can be done from any node remaining in the cluster or from a remote host.

To remove a node from a cluster

1. Take your application service groups offline (if under VCS control) on the node you want to remove.
   ```bash
   # hagrp -offline app_group -sys saturn
   ```

2. Stop the applications that use VxFS/CFS mount points and are not configured under VCS. Use native application commands to stop the applications.

3. Stop VCS on the node:
   ```bash
   # hastop -local
   ```

4. Unmount the VxFS/CFS file systems that are not configured under VCS.
   ```bash
   # umount mount_point
   ```
5  Uninstall SFCFS from the node using the SFCFS installer.

    # cd /opt/VRTS/install
    # ./uninstallsfcfs saturn

    The installer stops all SFCFS processes and uninstalls the SFCFS packages.

6  Modify the VCS configuration files on the existing nodes to remove references
to the deleted node.

    See “Modifying the VCS configuration files on existing nodes” on page 299.

Modifying the VCS configuration files on existing nodes

Modify the configuration files on the remaining nodes of the cluster to remove
references to the deleted nodes.

The process involves:

- Editing the /etc/llthosts file
- Editing the /etc/gabtab file
- Modifying the VCS configuration to remove the node

For an example main.cf:

    See “Sample configuration file for removing a node from the cluster” on page 303.

Editing the /etc/llthosts file

On each of the existing nodes, edit the /etc/llthosts file to remove lines that
contain references to the removed nodes.

For example, if saturn is the node removed from the cluster, remove the line "2
saturn" from the file:

    0 galaxy
    1 nebula
    2 saturn

    Change to:

    0 galaxy
    1 nebula
Editing the /etc/gabtab file

Modify the following command in the /etc/gabtab file to reflect the number of systems after the node is removed:

/sbin/gabconfig -c -nN

where N is the number of remaining nodes in the cluster.

For example, with two nodes remaining, the file resembles:

/sbin/gabconfig -c -n2

Modifying the VCS configuration to remove the node

Modify the VCS configuration file main.cf to remove all references to the deleted node.

Use one of the following methods to modify the configuration:

- Edit the /etc/VRTSvcs/conf/config/main.cf file
  This method requires application downtime.

- Use the command line interface
  This method allows the applications to remain online on all remaining nodes.

The following procedure uses the command line interface and modifies the sample VCS configuration to remove references to the deleted node. Run the steps in the procedure from one of the existing nodes in the cluster. The procedure allows you to change the VCS configuration while applications remain online on the remaining nodes.

To modify the VCS configuration using the CLI

1. Back up the /etc/VRTSvcs/conf/config/main.cf file.

   # cd /etc/VRTSvcs/conf/config

   # cp main.cf main.cf.3node.bak

2. Change the cluster configuration to read-write mode:

   # haconf -makerw

3. Remove the node from the AutoStartList attribute of the service group by specifying the remaining nodes in the desired order:

   # hagrp -modify cvm AutoStartList galaxy nebula
4  Remove the node from the SystemList attribute of the service group:

   ```
   # hagrp -modify cvm SystemList -delete saturn
   ```

5  Remove the node from the CVMNodeId attribute of the service group:

   ```
   # hares -modify cvm_clus CVMNodeId -delete saturn
   ```

6  If you have the other service groups (such as the database service group or the ClusterService group) that have the removed node in their configuration, perform step 4 and step 5 for each of them.

7  Remove the deleted node from the NodeList attribute of all CFS mount resources:

   ```
   # hares -modify CFSMount NodeList -delete saturn
   ```

8  Remove the deleted node from the system list of any other service groups that exist on the cluster. For example, to delete the node saturn:

   ```
   # hagrp -modify crsgrp SystemList -delete saturn
   ```

9  Remove the deleted node from the cluster system list:

   ```
   # hasys -delete saturn
   ```

10 Save the new configuration to disk:

    ```
    # haconf -dump -makero
    ```

11 Verify that the node is removed from the VCS configuration.

   ```
   # grep -i saturn main.cf
   ```

   If the node is not removed, use the VCS commands as described in this procedure to remove the node.

---

**Removing the node configuration from the CP server**

After removing a node from a SFCFS cluster, perform the steps in the following procedure to remove that node's configuration from the CP server.
To remove the node configuration from the CP server

1. Log into the CP server as the root user.

2. View the list of VCS users on the CP server, using the following command:

   ```bash
   # cpsadm -s cp_server -a list_users
   ``

   Where `cp_server` is the virtual IP/virtual hostname of the CP server.

3. Remove the VCS user associated with the node you previously removed from the cluster.

   For CP server in secure mode:
   ```bash
   # cpsadm -s cp_server -a rm_user \
   -e _HA_VCS_saturn@HA_SERVICES@saturn.nodes.example.com \
   -f cps_operator -g vx
   ``

   For CP server in non-secure mode:
   ```bash
   # cpsadm -s cp_server -a rm_user \
   -e cpsclient@saturn -f cps_operator -g vx
   ```

4. Remove the node entry from the CP server:

   ```bash
   # cpsadm -s cp_server -a rm_node -h saturn -c clus1 -n 2
   ``

5. View the list of nodes on the CP server to ensure that the node entry was removed:

   ```bash
   # cpsadm -s cp_server -a list_nodes
   ```

Removing security credentials from the leaving node

If the leaving node is part of a cluster that is running in a secure mode, you must remove the security credentials from node saturn. Perform the following steps.
To remove the security credentials

1. Kill the `/opt/VRTSat/bin/vxatd` process.

2. Remove the root credentials on node saturn.

   ```bash
   # vssat deletecred --domain type:domainname --prplname prplname
   ```

### Updating the Storage Foundation for Databases (SFDB) repository after removing a node

If you are using Database Checkpoints, Database Flashsnap, or SmartTier for Oracle in your configuration, update the SFDB repository to remove the reference for the node after removing the node from the cluster.

**Note:** If you have not created an SFDB repository, you do not need to perform the following steps.

#### To update the SFDB repository after removing a node

1. As Oracle user, list the nodes in the cluster:

   ```bash
   $ /opt/VRTSdbed/bin/dbed_rept_node -S $ORACLE_SID -o list
   ```

2. Run the following command after physically removing the node from the cluster.

   For example:

   ```bash
   $ /opt/VRTSdbed/bin/dbed_rept_node -S $ORACLE_SID -n NODE -o remove
   
   This completes the removal of the node from the SFDB repository.

### Sample configuration file for removing a node from the cluster

You may use this sample file as reference information to understand the configuration changes involved when you remove a node from a cluster.

The existing sample configuration before removing the node `system3` is as follows:

- The existing cluster `cluster1` comprises three nodes `system1`, `system2`, and `system3` and hosts a single database.
- The database is stored on CFS.
The database is managed by a VCS database agent. The agent starts, stops, and monitors the database.

Note: The following sample file shows in bold the configuration information that is removed when the node system3 is removed from the cluster.

```plaintext
include "types.cf"
include "CFSTypes.cf"
include "CVMTTypes.cf"

cluster cluster1 {
    UserNames = { admin = bopHo }
    Administrators = { admin }
    UseFence = SCSI3
}

cluster cluster1 {
    UserNames = { admin = bopHo }
    Administrators = { admin }
    UseFence = SCSI3
}

system system1 {
}

system system2 {
}

system system3 {
}

group app_grp {
    SystemList = { system1 = 0, system2 = 1, system3 = 2 }
    AutoFailOver = 0
    Parallel = 1
    AutoStartList = { system1, system2, system3 }
}

Note: In the following application resource, the system3 node information must be removed.
App appl (  
    Critical = 0  
    Sid @system1 = vrts1  
    Sid @system2 = vrts2  
    Sid @system3 = vrts3
)

CFSMount appdata_mnt (  
    Critical = 0  
    MountPoint = "/oradata"  
    BlockDevice = "/dev/vx/dsk/appdatadg/appdatavol"
)

CVMVolDg appdata_voldg (  
    Critical = 0  
    CVMDiskGroup = appdatadg  
    CVMVolume = { appdatavol }  
    CVMActivation = sw
)

requires group cvm online local firm  
appl requires appdata_mnt  
appdata_mnt requires appdata_voldg

---

**Note:** In the following CVM and CVMCluster resources, the *system3* node information must be removed.

---

group cvm (  
    SystemList = { system1 = 0, system2 = 1, system3 = 2}  
    AutoFailOver = 0  
    Parallel = 1  
    AutoStartList = { system1, system2, system3 }
)

CFSfsckd vxfsckd (  
)

CVMCluster cvm_clus (  
    CVMClustName = rac_cluster101  
    CVMNodeId = { system1 = 0, system2 = 1, system3 = 2 }  
)
CVMTransport = gab
CVMTimeout = 200
)

CVMVxconfigd cvm_vxconfigd (  
    Critical = 0  
    CVMVxconfigdArgs = { syslog }  
)

vxfsckd requires cvm_clus

cvm_clus requires cvm_vxconfigd
Setting up and configuring replicated global cluster

- Chapter 20. Setting up a replicated global cluster
- Chapter 21. Configuring a global cluster using VVR
Setting up a replicated global cluster

This chapter includes the following topics:

- Replication in the SFCFS environment
- Requirements for SFCFS global clusters
- About setting up a global cluster in an SFCFS environment
- Configuring a cluster at the primary site
- Configuring a cluster at the secondary site
- Configuring replication on clusters at both sites
- Modifying the ClusterService group for global clusters
- Defining the remote cluster and heartbeat objects
- Configuring the VCS service groups for global clusters

Replication in the SFCFS environment

You can set up a primary SFCFS cluster for replication to a secondary SFCFS cluster by configuring global VCS service groups and using a replication technology. The application cluster at the secondary site can be a single node cluster. For example, you can have a two-node cluster on the primary site and a two-node or single-node cluster on the secondary site.

You can use one of the following replication technologies:
Veritas Volume Replicator (VVR), which provides host-based volume replication. Using VVR you can replicate data volumes on a shared disk group in SFCFS.

- Supported hardware-based replication technologies. Using hardware-based replication you can replicate data from a primary array to a secondary array.
- Using SFCFS with VVR you can run a fire drill to verify the disaster recovery capability of your configuration.
  
  See the *Veritas Storage Foundation for Oracle RAC Administrator’s Guide*.

### Requirements for SFCFS global clusters

Review the requirements information to make sure your configuration is supported for SFCFS.

For product licensing information:

See “About Veritas product licensing” on page 51.

### Supported software and hardware for SFCFS

For supported hardware and software:

- See “Hardware overview and requirements for Veritas Storage Foundation Cluster File System” on page 40.
- See the current compatibility list in the Veritas Technical Support website to confirm the compatibility of your hardware:
  
  http://entsupport.symantec.com/docs/283161

### Supported replication technologies for SFCFS

SFCFS supports the following replication technologies through the use of Veritas replication agents:
<table>
<thead>
<tr>
<th>Replication technology</th>
<th>Supported modes</th>
<th>Supported software</th>
</tr>
</thead>
<tbody>
<tr>
<td>Veritas Volume Replicator (VVR) Supporting agents</td>
<td>■ Asynchronous replication</td>
<td>Host-based replication</td>
</tr>
<tr>
<td></td>
<td>■ Synchronous replication</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RVGShared</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RVGSharedPri</td>
<td></td>
</tr>
<tr>
<td></td>
<td>RVGLogOwner</td>
<td></td>
</tr>
<tr>
<td>EMC SRDF Supporting agent: SRDF</td>
<td>■ Asynchronous replication</td>
<td>All versions of Solutions Enabler</td>
</tr>
<tr>
<td></td>
<td>■ Synchronous replication</td>
<td></td>
</tr>
<tr>
<td>Hitachi True Copy Supporting agent: HTC</td>
<td>■ Asynchronous replication</td>
<td>All versions of the Hitachi CCI</td>
</tr>
<tr>
<td></td>
<td>■ Synchronous replication</td>
<td></td>
</tr>
<tr>
<td>IBM Metro Mirror Supporting agent: MetroMirror</td>
<td>Synchronous replication</td>
<td>All versions of IBM DSCLI. The MetroMirror agent is supported for DS6000 and DS8000 arrays</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>IBM SVC SVC CopyServices</td>
<td>■ Asynchronous replication</td>
<td>SSH access to the SVC</td>
</tr>
<tr>
<td></td>
<td>■ Synchronous replication</td>
<td></td>
</tr>
<tr>
<td>EMC Mirror View Supporting agent: MirrorView</td>
<td>■ Asynchronous replication</td>
<td>All versions of NaviCLI</td>
</tr>
<tr>
<td></td>
<td>■ Synchronous replication only individual LUNs may be replicated</td>
<td></td>
</tr>
</tbody>
</table>

**Note:** Check your vendor's compatibility list for the supported software versions. The support listed above only exists if the host, HBA, and array combination is in your vendor's hardware compatibility list. Check your array documentation.

**Note:** All arrays must support SCSI-3 persistent reservations for SFCFS.
You can use the Veritas replication agents listed in the table above for global clusters that run SFCFS. The Veritas replication agents provide application failover and recovery support to your replication configuration. The agents provide this support for environments where data is replicated between clusters.

VCS agents control the direction of replication. They do not monitor the progress or status of replication. The replication agents manage the state of replicated devices that are attached to SFCFS nodes. The agents make sure that the system which has the resource online also has safe and exclusive access to the configured devices.

This information is current at the time this document is released. For more current information on the replicated agents, see:

- Veritas Cluster Server Agent for EMC SRDF Installation and Configuration Guide
- Veritas Cluster Server Agent for Hitachi TrueCopy Installation and Configuration Guide
- Veritas Cluster Server Agent for IBM Metro Mirror Installation and Configuration Guide
- Veritas Cluster Server Agent for IBM SVC Installation and Configuration Guide
- Veritas Cluster Server Agent for EMC MirrorView Installation and Configuration Guide
- Veritas Cluster Server Agent for Oracle Data Guard Installation and Configuration Guide
- Technical Support TechNote for the latest updates or software issues for replication agents: [http://entsupport.symantec.com/docs/282004htm](http://entsupport.symantec.com/docs/282004htm)

### About setting up a global cluster in an SFCFS environment

Configuring a global cluster for application requires the coordination of many component setup tasks. The procedures provided in this document are guidelines. The tasks required to set up a global cluster:

- Configure an SFCFS cluster at the primary site
- Configure an SFCFS cluster at the secondary site
- Configure replication on clusters at both sites
- Configure VCS service groups for replication
Test the HA/DR configuration

Upon successful testing, bring the environment into production

Some SFCFS HA/DR configuration tasks may require adjustments depending upon your particular starting point, environment, and configuration. Review the installation requirements and sample cluster configuration files for primary and secondary clusters.

Configuring a cluster at the primary site

You can use an existing SFCFS cluster or you can install a new SFCFS cluster for your primary site.

For planning information:

See “About planning for SFCFS installation” on page 27.

If you are using an existing cluster as the primary and you want to set up a global cluster, skip the steps below and proceed to configure your secondary cluster.

See “Configuring a cluster at the secondary site” on page 315.

Note: You must have a GCO license enabled for a global cluster. If you are using VVR for replication, you must have a VVR license enabled.

If you do not have an existing cluster and you are setting up two new sites for an SFCFS global cluster, follow the steps below.

To set up the cluster and database at the primary site

1. Install and configure servers and storage.

2. If you are using hardware-based replication, install the software for managing your array.

3. Verify that you have the correct installation options enabled, whether you are using keyless licensing or installing keys manually. You must have the GCO option for a global cluster. If you are using VVR for replication, you must have it enabled.
4  Install and configure SFCFS. Prepare for your installation according to your configuration needs.

For preparation:

See “Prerequisites for Veritas Storage Foundation Cluster File System” on page 39.

For installation:

See “About the Web-based installer” on page 65.

5  For a multi-node cluster, configure I/O fencing.

■ Verify the shared storage on the secondary site supports SCSI-3 reservations.
■ Set up coordinator disks
■ Configure I/O fencing

For instructions for setting up fencing:

See “About planning to configure I/O fencing” on page 88.

6  Verify the CVM group is online on all nodes in the primary cluster:

```
# hagrp -state cvm
```

7  Prepare systems and storage for a global cluster. Identify the hardware and storage requirements before installing your database software.

You will need to set up:

■ Local storage for database software
■ Shared storage for resources which are not replicated
■ Replicated storage for database files

8  Install and configure the database binaries. Consult your database documentation.

**Note:** Resources which will not be replicated must be on non-replicated shared storage.

After successful database installation and configuration, verify that database resources are up on all nodes.

9  Identify the disks that will be replicated, create the required CVM disk group, volume, and file system.
10 Create the database on the file system you created in the previous step.
11 Configure the VCS service groups for the database.
12 Verify that all VCS service groups are online.

Configuring a cluster at the secondary site

To set up a multi-node or single-node cluster on the secondary site:

- Set up the cluster
- Set up the database

The setup requirements for the secondary site parallel the requirements for the primary site with a few additions or exceptions as noted below.

Important requirements for global clustering:

- Cluster names on the primary and secondary sites must be unique.
- Make sure that you use the same OS user and group IDs for Oracle for installation and configuration on both the primary and secondary clusters.

Setting up the cluster on the secondary site

To set up the cluster on secondary site

1 Install and configure servers and storage.
2 If you are using hardware-based replication, install the software for managing your array.
3 Verify that you have the correct installation options enabled, whether you are using keyless licensing or installing keys manually. You must have the GCO option for a global cluster. If you are using VVR for replication, you must have it enabled.
4 Install and configure SFCFS. Prepare for your installation according to your configuration needs.
   For preparation:
   See “Prerequisites for Veritas Storage Foundation Cluster File System” on page 39.
   For installation:
   See “About the Web-based installer” on page 65.
5 For a multi-node cluster, configure I/O fencing.
Verify the shared storage on the secondary site supports SCSI-3 reservations.

Set up coordinator disks

Configure I/O fencing

For instructions for setting up fencing:

See “About planning to configure I/O fencing” on page 88.

6 For a single-node cluster, do not enable I/O fencing. Fencing will run in disabled mode.

7 Prepare systems and storage for a global cluster. Identify the hardware and storage requirements before installing your database software.

You will need to set up:

- Local storage for database software
- Shared storage for resources which are not replicated
- Replicated storage for database files

8 Install and configure the database binaries. Consult your database documentation.

**Note:** Resources which will not be replicated must be on non-replicated shared storage.

After successful database installation and configuration, verify that database resources are up on all nodes.

**Setting up the database for the secondary site**

**To set up the database for the secondary site**

1 Do not create the database. The database will be replicated from the primary site.

- If you are using hardware-based replication, the database, disk group, and volumes will be replicated from the primary site.
  Create the directory for the CFS mount point which will host the database data and control files.

- If you are using VVR for replication, create an identical disk group and volumes for the replicated content with the same names and size as listed on the primary site.
Create the directories for the CFS mount points as they are on the primary site. These will be used to host the database and control files when the failover occurs and the secondary is promoted to become the primary site.

2. Copy the init$ORACLE_SID.ora file from $ORACLE_HOME/dbs at the primary to $ORACLE_HOME/dbs at the secondary.

3. Create subdirectories for the database as you did on the primary site.

**Configuring replication on clusters at both sites**

You must configure replication for the database files. Once replication is configured, make sure it is functioning correctly by testing before proceeding.

**To configure replication at both sites**

1. At both sites, identify the disks on which the database resides at the primary site and associate them with the corresponding disks at the secondary site.
   
   See “Setting up replication using VVR on the primary site” on page 324.

2. Start replication between the sites.
   
   See “Starting replication of application database volume” on page 331.

**Modifying the ClusterService group for global clusters**

You have configured VCS service groups for the database on each cluster. Each cluster requires an additional virtual IP address associated with the cluster for cross-cluster communication. The VCS installation and creation of the ClusterService group typically involves defining this IP address.

Configure a global cluster by setting:

- Heartbeat
- Wide area cluster (wac)
- GCO IP (gcoip)
- remote cluster resources

See the Veritas Cluster Server User’s Guide for complete details on global clustering.

**Modifying the global clustering configuration using the wizard**

The global clustering wizard completes the following tasks:
Validates the ability of the current configuration to support a global cluster environment.

Creates the components that enable the separate clusters, each of which contains a different set of GAB memberships, to connect and operate as a single unit.

Creates the ClusterService group, or updates an existing ClusterService group.

Run the global clustering configuration wizard on each of the clusters; you must have the global clustering license in place on each node in the cluster.

To modify the ClusterService group for global clusters using the global clustering wizard

1. On the primary cluster, start the GCO Configuration wizard:

   ```
   # /opt/VRTSvcs/bin/gcoconfig
   ```

2. The wizard discovers the NIC devices on the local system and prompts you to enter the device to be used for the global cluster. Specify the name of the device and press Enter.

3. If you do not have NIC resources in your configuration, the wizard asks you whether the specified NIC will be the public NIC used by all the systems. Enter y if it is the public NIC; otherwise enter n. If you entered n, the wizard prompts you to enter the names of NICs on all systems.

4. Enter the virtual IP address for the local cluster.

5. If you do not have IP resources in your configuration, the wizard prompts you for the netmask associated with the virtual IP. The wizard detects the netmask; you can accept the suggested value or enter another one.

   The wizard starts running commands to create or update the ClusterService group. Various messages indicate the status of these commands. After running these commands, the wizard brings the ClusterService group online.

---

**Defining the remote cluster and heartbeat objects**

After configuring global clustering, add the remote cluster object to define the IP address of the cluster on the secondary site, and the heartbeat object to define the cluster-to-cluster heartbeat.

Heartbeats monitor the health of remote clusters. VCS can communicate with the remote cluster only after you set up the heartbeat resource on both clusters.
To define the remote cluster and heartbeat

1. On the primary site, enable write access to the configuration:
   
   ```
   # haconf -makerw
   ```

2. Define the remote cluster and its virtual IP address.
   In this example, the remote cluster is clus2 and its IP address is 10.11.10.102:
   
   ```
   # haclus -add clus2 10.11.10.102
   ```

3. Complete step 1 and step 2 on the secondary site using the name and IP address of the primary cluster.
   In this example, the primary cluster is clus1 and its IP address is 10.10.10.101:
   
   ```
   # haclus -add clus1 10.10.10.101
   ```

4. On the primary site, add the heartbeat object for the cluster. In this example, the heartbeat method is ICMP ping.
   
   ```
   # hahb -add Icmp
   ```

5. Define the following attributes for the heartbeat resource:
   - ClusterList lists the remote cluster.
   - Arguments enables you to define the virtual IP address for the remote cluster.
   
   For example:
   
   ```
   # hahb -modify Icmp ClusterList clus2
   # hahb -modify Icmp Arguments 10.11.10.102 -clus clus2
   ```

6. Save the configuration and change the access to read-only on the local cluster:
   
   ```
   # haconf -dump -makero
   ```
7. Complete step 4-6 on the secondary site using appropriate values to define the cluster on the primary site and its IP as the remote cluster for the secondary cluster.

8. Verify cluster status with the `hastatus -sum` command on both clusters.

```bash
# hastatus -sum
```
Display the global setup by executing haclus -list command.

```bash
# haclus -list
  clus1
  clus2
```

Example of heartbeat additions to the main.cf file on the primary site:

```plaintext
remotecluster clus2 {
  Cluster Address = "10.11.10.102"
}
heartbeat Icmp {
  ClusterList = { clus2 }
  Arguments @clus2 = { "10.11.10.102" }
}
```

```plaintext
system galaxy {
}
```

Example heartbeat additions to the main.cf file on the secondary site:

```plaintext
remotecluster clus1 {
  Cluster Address = "10.10.10.101"
}
heartbeat Icmp {
  ClusterList = { clus1 }
  Arguments @clus1 = { "10.10.10.101" }
}
```

```plaintext
system mercury {
}
```

See the Veritas Cluster Server User’s Guide for details for configuring the required and optional attributes of the heartbeat object.
Configuring the VCS service groups for global clusters

To configure VCS service groups for global clusters

1  Configure and enable global groups for databases and resources.
   ■  Configure VCS service groups at both sites.
   ■  Configure the replication agent at both sites.

2  To test real data in an environment where HA/DR has been configured,
   schedule a planned migration to the secondary site for testing purposes.
   For example:
   See “Migrating the role of primary site to the secondary site” on page 344.
   See “Migrating the role of new primary site back to the original primary site”
   on page 345.

3  Upon successful testing, bring the environment into production.
   For complete details on VVR in a shared disk environment:
   See the Veritas Volume Replicator Administrator’s Guide.
Configuring a global cluster using VVR

This chapter includes the following topics:

- About configuring global clustering using VVR
- Setting up replication using VVR on the primary site
- Setting up replication using VVR on the secondary site
- Starting replication of application database volume
- Configuring VCS to replicate the database volume using VVR
- Using VCS commands on SFCFS global clusters
- Using VVR commands on SFCFS global clusters

About configuring global clustering using VVR

Before configuring clusters for global clustering, make sure both clusters have product and database software installed and configured.

Verify that you have the correct installation options enabled, whether you are using keyless licensing or installing keys manually. You must have the GCO option for a global cluster and VVR enabled.

See “About Veritas product licensing” on page 51.

After setting up two clusters running SFCFS, you can configure a global cluster environment with VVR. You must modify both cluster configurations to support replication in the global cluster environment.

Configuring SFCFS for global clusters requires:
Setting up both clusters as part of a global cluster environment.
See “About setting up a global cluster in an SFCFS environment” on page 312.

Setting up replication for clusters at both sites.
See “Setting up replication using VVR on the primary site” on page 324.
See “Setting up replication using VVR on the secondary site” on page 327.

Starting replication of the database.
See “Starting replication of application database volume” on page 331.

Configuring VCS for replication on clusters at both sites.
See “Configuring VCS to replicate the database volume using VVR” on page 333.

Setting up replication using VVR on the primary site

Setting up replication with VVR in a global cluster environment involves the following tasks:

- If you have not already done so, create a disk group on the storage on the primary site.
- Creating the Storage Replicator Log (SRL) in the disk group for the database.
  See “Creating the SRL volume on the primary site” on page 324.
- Creating the Replicated Volume Group (RVG) on the primary site.
  See “Setting up the Replicated Volume Group (RVG) on the primary site” on page 325.

Creating the SRL volume on the primary site

Create the SRL. The SRL is a volume in the RVG. The RVG also holds the data volumes for replication.

- The data volume on the secondary site has the same name and the same size as the data volume on the primary site.
- The SRL on the secondary site has the same name and the same size as the SRL on the primary site.
- The data volume and SRL volume should exist in the same disk group.
- If possible, create SRLs on disks without other volumes.
- Mirror SRLs and data volumes in the absence of hardware-based mirroring.
To create the SRL volume on the primary site

1. On the primary site, determine the size of the SRL volume based on the configuration and amount of use.
   
   See the Veritas Volume Replicator documentation for details.

2. Using the following command, determine whether a node is the master or the slave:

   ```
   # vxdctl -c mode
   ```

3. From the master node, issue the following command:

   ```
   # vxassist -g oradatadg make rac1_srl 1500M nmirror=2 disk4 disk5
   ```

4. Using the following command, start the SRL volume by starting all volumes in the disk group:

   ```
   # vxvol -g oradatadg startall
   ```

Setting up the Replicated Volume Group (RVG) on the primary site

Before creating the RVG on the primary site, make sure the volumes and CVM group are active and online.
To review the status of replication objects on the primary site

1. Verify the volumes you intend to include in the group are active.
2. Review the output of the hagrp -state cvm command to verify that the CVM group is online.
3. On each site, verify vradmin is running:

   ```
   # ps -ef |grep vradmin
   root  536594  598036  0 12:31:25  0 0:00 grep vradmin
   ```

   If vradmin is not running start it:

   ```
   # vxstart_vvr
   VxVM VVR INFO V-5-2-3935 Using following ports:
   heartbeat: 4145
   vradmind: 8199
   vxrsyncd: 8989
   data: Anonymous-Ports
   To change, see vrport(1M) command
   # ps -ef |grep vradmin
   root  536782  1 0 12:32:47 - 0:00 /usr/sbin/vradmind
   root 1048622 598036 0 12:32:55 0 0:00 grep vradmin
   # netstat -an |grep 4145
   tcp4 0 0 *.4145 *.* LISTEN
   udp4 0 0 *.4145 *.*
   ```

To create the RVG

The command to create the primary RVG takes the form:

```
vradmin -g disk_group createpri rvg_name data_volume srl_volume
```

where:

- `disk_group` is the name of the disk group containing the database
- `rvg_name` is the name for the RVG
- `data_volume` is the volume that VVR replicates
- `srl_volume` is the volume for the SRL

For example, to create the rac1_rvg RVG, enter:

```
# vradmin -g oradatadg createpri rac1_rvg rac1_vol rac1_srl
```

The command creates the RVG on the primary site and adds a Data Change Map (DCM) for each data volume. In this case, a DCM exists for rac1_vol.
Setting up replication using VVR on the secondary site

To create objects for replication on the secondary site, use the vradmin command with the addsec option. To set up replication on the secondary site, perform the following tasks:

- If you have not already done so, create a disk group to hold data volume, SRL, and RVG on the storage on the secondary site.
- Create volumes for the database and SRL on the secondary site.
  See “Creating the data and SRL volumes on the secondary site” on page 327.
- Edit the /etc/vx/vras/.rdg file on the secondary site.
  See “Editing the /etc/vx/vras/.rdg files” on page 328.
- Use resolvable virtual IP addresses that set network RLINK connections as host names of the primary and secondary sites.
  See “Setting up IP addresses for RLINKs on each cluster” on page 328.
- Create the replication objects on the secondary site.
  See “Setting up the disk group on secondary site for replication” on page 329.

Creating the data and SRL volumes on the secondary site

Note the following when creating volumes for the data and SRL:

- The sizes and names of the volumes must reflect the sizes and names of the corresponding volumes in the primary site.
- Create the data and SRL volumes on different disks in the disk group. Use the vxdisk -g diskgroup list command to list the disks in the disk group.
- Mirror the volumes.

To create the data and SRL volumes on the secondary site

1. In the disk group created for the application database, create a data volume of same size as that in primary for data; in this case, the rac_vol1 volume on the primary site is 6.6 GB:

   ```bash
   # vxassist -g oradatadg make rac_vol1 6600M nmirror=2 disk1 disk2
   ```
Create the volume for the SRL, using the same name and size of the equivalent volume on the primary site. Create the volume on different disks from the disks for the database volume, but on the same disk group that has the data volume:

```
# vxassist -g oradatadg make rac1_srl 1500M nmirror=2 disk4 disk6
```

### Editing the `/etc/vx/vras/.rdg` files

Editing the `/etc/vx/vras/.rdg` file on the secondary site enables VVR to replicate the disk group from the primary site to the secondary site. On each node, VVR uses the `/etc/vx/vras/.rdg` file to check the authorization to replicate the RVG on the primary site to the secondary site. The file on each node in the secondary site must contain the primary disk group ID, and likewise, the file on each primary system must contain the secondary disk group ID.

**To edit the `/etc/vx/vras/.rdg` files**

1. On a node in the primary site, display the primary disk group ID:

   ```
   # vxprint -l diskgroup
   ...
   ```

2. On each node in the secondary site, edit the `/etc/vx/vras/.rdg` file and enter the primary disk group ID on a single line.

3. On each cluster node of the primary cluster, edit the `/etc/vx/vras/.rdg` file and enter the secondary disk group ID on a single line.

### Setting up IP addresses for RLINKs on each cluster

Creating objects with the `vradmin` command requires resolvable virtual IP addresses that set network RLINK connections as host names of the primary and secondary sites.

**To set up IP addresses for RLINKs on each cluster**

1. For each RVG running on each cluster, set up a virtual IP address on one of the nodes of the cluster. These IP addresses are part of the RLINK.

   The example assumes for the cluster on the primary site:

   - The public network interface is lan0:1
   - The virtual IP address is 10.10.9.101
The net mask is 255.255.255.0

# ifconfig lan0:1 plumb
# ifconfig lan0:1 inet 10.10.9.101 netmask 255.255.255.0
# ifconfig lan0:1 up

2 Use the same commands with appropriate values for the interface, IP address, and net mask on the secondary site.

The example assumes for the secondary site:

- The public network interface is lan0:1
- virtual IP address is 10.11.9.102
- net mask is 255.255.255.0

3 Define the virtual IP addresses to correspond to a virtual cluster host name on the primary site and a virtual cluster host name on the secondary site.

Update the /etc/hosts file on all the nodes on both the primary and secondary sites.

The examples assume:

- clus1 has IP address 10.10.9.101
- clus2 has IP address 10.11.9.102

4 Use the ping command to verify the links are functional.

**Setting up the disk group on secondary site for replication**

Create the replication objects on the secondary site from the master node of the primary site, using the `vradmin` command.

**To set up the disk group on the secondary site for replication**

1 Issue the command in the following format from the cluster on the primary site:

```
# vradmin -g dg_pri addsec rvg_pri pri_host sec_host
```

where:

- `dg_pri` is the disk group on the primary site that VVR will replicate. For example: rac1_vol
- `rvg_pri` is the RVG on the primary site. For example: rac1_rvg
- pri_host is the virtual IP address or resolvable virtual host name of the cluster on the primary site.
  For example: clus1_1

- sec_host is the virtual IP address or resolvable virtual host name of the cluster on the secondary site.
  For example: clus2_1

For example, the command to add the cluster on the primary site to the Replicated Data Set (RDS) is:

```
vradmin -g oradatadg addsec rac1_rvg \
cclus1_1
clus2_1
```

On the secondary site, the above command performs the following tasks:

- Creates an RVG within the specified disk group using the same name as the one for the primary site
- Associates the data and SRL volumes that have the same names as the ones on the primary site with the specified RVG
- Adds a data change map (DCM) for the data volume
- Creates cluster RLINKS for the primary and secondary sites with the default names

2 Verify the list of RVGs in the RDS by executing the following command.

```
# vradmin -g oradatadg -l printrvg
```

For example:

Replicated Data Set: rac1_rvg
Primary:
HostName: 10.180.88.187 <localhost>
RvgName: rac1_rvg
DgName: rac1_vol
datavol_cnt: 1
vset_cnt: 0
srl: rac1_srl
RLinks:
name=r1k_clus2_1_rac1_rvg, detached=on, synchronous=off
Secondary:
Starting replication of application database volume

When you have both the primary and secondary sites set up for replication, you can start replication from the primary site to the secondary site.

Start with the default replication settings:

- Mode of replication: synchronous=off
- Latency Protection: latencyprot=off
- SRL overflow protection: srlprot_autodcm
- Packet size: packet_size=8400
- Network protocol: protocol=UDP

Method of initial synchronization:

- Automatic synchronization
- Full synchronization with Checkpoint

For guidelines on modifying these settings and information on choosing the method of replication for the initial synchronization:

See the Veritas Volume Replicator Administrator’s Guide

Starting replication using automatic synchronization

Use the `vradmin` command to start replication or the transfer of data from the primary site to the secondary site over the network. Because the cluster on the secondary site uses only one host name, the command does not require the `sec_host` argument.
To start replication using automatic synchronization

- From the primary site, use the following command to automatically synchronize the RVG on the secondary site:

```
vradmin -g disk_group -a startrep pri_rvg sec_host
```

where:

- `disk_group` is the disk group on the primary site that VVR will replicate
- `pri_rvg` is the name of the RVG on the primary site
- `sec_host` is the virtual host name for the secondary site

For example:

```
# vradmin -g oradatadg -a startrep rac1_rvg clus2
```

Starting replication using full synchronization with Checkpoint

Use the `vradmin` command with the Checkpoint option to start replication using full synchronization with Checkpoint.

To start replication using full synchronization with Checkpoint

1. From the primary site, synchronize the RVG on the secondary site with full synchronization (using the `-c checkpoint` option):

```
vradmin -g disk_group -full -c ckpt_name syncrvg pri_rvg sec_host
```

where:

- `disk_group` is the disk group on the primary site that VVR will replicate
- `ckpt_name` is the name of the checkpoint on the primary site
- `pri_rvg` is the name of the RVG on the primary site
- `sec_host` is the virtual host name for the secondary site

For example:
Verifying replication status

Verify that replication is properly functioning.

To verify replication status

1. Check the status of VVR replication:

   # vradmin -g disk_group_name repstatus rvg_name

2. Review the flags output for the status. The output may appear as connected and consistent. For example:

   # vxprint -g oradatadg -l rlk_clus2_1_rac1_rvg
   Rlink: rlk_clus2_1_rac1_rvg
   info: timeout=500 packet_size=8400 rid=0.1078
       latency_high_mark=10000 latency_low_mark=9950
       bandwidth_limit=none
   state: state=ACTIVE
       synchronous=off latencyprot=off srlprot=autodcm
   .
   .
   protocol: UDP/IP
   checkpoint: rac1_ckpt
   flags: write enabled attached consistent connected asynchronous

Configuring VCS to replicate the database volume using VVR

After configuring both clusters for global clustering and setting up the application database for replication, configure VCS to provide high availability for the database. Specifically, configure VCS agents to control the cluster resources, including the replication resources.
About modifying the VCS configuration for replication

The following resources must be configured or modified for replication:

- Log owner group
- RVG group
- CVMVolDg resource
- RVGSharedPri resource
- application database service group

For more information on service replication resources:

See the *Veritas Cluster Server Agents for Veritas Volume Replicator Configuration Guide.*

**Log owner group**

Create a log owner group including the RVGLogowner resources. The RVGLogowner resources are used by:

- RLINKs for the RVG
- RVGLogowner resource. The RVG and its associated disk group are defined as attributes for the RVGLogowner resource.

The RVG log owner service group has an online local firm dependency on the service group containing the RVG.

The VCS uses the following agents to control the following resources:

- RVGLogowner agent to control the RVGLogowner resource
- RVGShared agent to control the RVGShared resource

**RVG group**

Create an RVG group that includes the RVGShared resource replication objects. Define the RVGShared resource and CVMVolDg resource together within a parallel service group. The group is defined as parallel because it may be online at the same time on all cluster nodes.

**CVMVolDg resource**

The CVMVolDg resource does not have volumes specified for the CVMVolume attribute; the volumes are contained in the RVG resource. The CVMVolume attribute for the CVMVolDg resource is empty because all volumes in the RVG are defined by the RVG attribute of the RVGShared resource. The RVG service group has an online local firm dependency on the CVM service group.
For a detailed description of the CVMVolDg agent in this guide:
See “CVMVolDg agent” on page 429.

**RVGSharedPri resource**

Add the RVGSharedPri resource to the existing application database service group. The CVMVolDg resource must be removed from the existing application database service group.

**application database service group**

The existing application database service group is a parallel group consisting of the application database resource, CVMVolDg resource, and CFSMount resource (if the database resides in a cluster file system). Define the application service group as a global group by specifying the clusters on the primary and secondary sites as values for the ClusterList group attribute.

### Modifying the VCS Configuration on the Primary Site

The following are the procedural highlights required to modify the existing VCS configuration on the primary site:

- Configure two service groups:
  - A log owner group including the RVGLogowner resource.
  - An RVG group including the RVGShared resource replication objects.

- Add the RVGSharedPri resource to the existing application database service group and define this group as a global group by setting the ClusterList and ClusterFailOverPolicy attributes.

- Move the CVMVolDg resource from the existing application database service group to the newly created RVG group.

#### To modify VCS on the primary site

1. Log into one of the nodes on the primary cluster.
2. Use the following command to save the existing configuration to disk, and make the configuration read-only while you make changes:
   
   ```bash
   # haconf -dump -makero
   ```

3. Use the following command to make a backup copy of the main.cf file:
   
   ```bash
   # cd /etc/VRTSvcs/conf/config
   # cp main.cf main.orig
   ```
Use vi or another text editor to edit the main.cf file. Review the sample configuration file after the SFCFS installation. Add a failover service group using the appropriate values for your cluster and nodes. Include the following resources:

- RVGLogowner resource. The node on which the group is online functions as the log owner (node connected to the second cluster for the purpose of replicating data).
- IP resource
- NIC resources

The following are examples of RVGLogowner service group for the different platforms.

```plaintext
group rlogowner {
  SystemList = { galaxy = 0, nebula = 1 }
  AutoStartList = { galaxy,nebula }
}

IP logowner_ip {
  Device = lan0
  Address = "10.10.9.101"
  NetMask = "255.255.255.0"
}

NIC nic {
  Device = lan0
  NetworkType = ether
  NetworkHosts = "10.10.8.1"
}

RVGLogowner logowner {
  RVG = rac1_rvg
  DiskGroup = oradatadg
}

requires group RVGgroup online local firm
logowner requires logowner_ip
logowner_ip requires nic
```
5 Add the RVG service group using the appropriate values for your cluster and nodes.

Example RVGgroup service group:

```plaintext
group RVGgroup (  
    SystemList = { galaxy = 0, nebula = 1 }  
    Parallel = 1  
    AutoStartList = { galaxy, nebula }  
)  
RVGShared racdata_rvg (  
    RVG = racl_rvg  
    DiskGroup = oradatadg  
)  
CVMVolDg racdata_voldg (  
    CVMDiskGroup = oradatadg  
    CVMActivation = sw  
)  
requires group cvm online local firm  
racdata_rvg requires racdata_voldg
```

6 Modify the application service group using the appropriate values for your cluster and nodes:

- Define the application service group as a global group by specifying the clusters on the primary and secondary sites as values for the ClusterList group attribute. See the bolded attribute in the example that follows.
- Add the ClusterFailOverPolicy cluster attribute. Symantec recommends using the Manual value. See the bolded attribute in the example.
- Add the RVGSharedPri resource to the group configuration.
- Remove the CVMVolDg resource, if it has been configured in your previous configuration. This resource is now part of the RVG service group.
- Specify the service group (online, local, firm) to depend on the RVG service group.
- Remove the existing dependency of the Database service group on the CVM service group. Remove the line:

  ```plaintext
  requires group CVM online local firm
  ```
- Remove the existing dependency between the CFSMount for the database and the CVMVoldg for the application database. Remove the line:
oradata_mnt requires oradata_voldg

The following is an example of an application database service group configured for replication:

group database_grp {
    SystemList = { galaxy = 0, nebula = 1 }
    ClusterList = { clus1 = 0, clus2 = 1 }
    Parallel = 1
    ClusterFailOverPolicy = Manual
    Authority = 1
    AutoStartList = { galaxy, nebula }
}

CFSMount oradata_mnt {
    MountPoint = "/oradata"
    BlockDevice = "/dev/vx/dsk/oradatadg/rac1_vol"
}

RVGSharedPri ora_vvr_shpri {
    RvgResourceName = racdata_rvg
    OnlineRetryLimit = 0
}

requires group RVGgroup online local firm
oradata_mnt requires ora_vvr_shpri

7 Save and close the main.cf file.
8 Use the following command to verify the syntax of the /etc/VRTSvcs/conf/config/main.cf file:

    # hacf -verify /etc/VRTSvcs/conf/config

9 Stop and restart VCS.

    # hastop -all -force

Wait for port h to stop on all nodes, and then restart VCS with the new configuration on all primary nodes:

    # hastart
Modifying the VCS Configuration on the Secondary Site

The following are highlights of the procedure to modify the existing VCS configuration on the secondary site:

- Add the log owner and RVG service groups.
- Add a service group to manage the application database and the supporting resources.
- Define the replication objects and agents, such that the cluster at the secondary site can function as a companion to the primary cluster.

The following steps are similar to those performed on the primary site.

To modify VCS on the secondary site

1. Log into one of the nodes on the secondary site as root.

2. Use the following command to save the existing configuration to disk, and make the configuration read-only while making changes:

   ```bash
   # haconf -dump -makero
   ```

3. Use the following command to make a backup copy of the main.cf file:

   ```bash
   # cd /etc/VRTSvcs/conf/config
   # cp main.cf main.orig
   ```

4. Use vi or another text editor to edit the main.cf file. Edit the CVM group on the secondary site.

   Review the sample configuration file after the SFCFS installation to see the CVM configuration.

   In our example, the secondary site has clus2 consisting of the nodes mercury and jupiter. To modify the CVM service group on the secondary site, use the CVM group on the primary site as your guide.

5. Add a failover service group using the appropriate values for your cluster and nodes. Include the following resources:

   - RVGLogowner resource. The node on which the group is online functions as the log owner (node connected to the second cluster for the purpose of replicating data).
   - IP resource
   - NIC resources

Example RVGLogowner service group:
group rlogowner {
    SystemList = { mercury = 0, jupiter = 1 }
    AutoStartList = { mercury, jupiter }
}

IP logowner_ip {
    Device = lan0
    Address = "10.11.9.102"
    NetMask = "255.255.255.0"
}

NIC nic {
    Device = lan0
    NetworkHosts = { "10.10.8.1" }
    NetworkType = ether
}

RVGLogowner logowner {
    RVG = rac1_rvg
    DiskGroup = oradatadg
}

requires group RVGgroup online local firm
logowner requires logowner_ip
logowner_ip requires nic
6  Add the RVG service group using the appropriate values for your cluster and nodes.

The following is an example **RVGgroup service group**:

```plaintext
group RVGgroup (  
    SystemList = { mercury = 0, jupiter = 1 }  
    Parallel = 1  
    AutoStartList = { mercury, jupiter }  
)

RVGShared racdata_rvg (  
    RVG = rac1_rvg  
    DiskGroup = oradatadg  
)

CVMVolDg racdata_voldg  
    CVMDiskGroup = oradatadg  
    CVMActivation = sw  
)

requires group cvm online local firm  
racdata_rvg requires racdata_voldg
```

7  Add an application service group. Use the application service group on the primary site as a model for the application service group on the secondary site.

- Define the application service group as a global group by specifying the clusters on the primary and secondary sites as values for the ClusterList group attribute.
- Assign this global group the same name as the group on the primary site; for example, `database_grp`.
- Include the ClusterList and ClusterFailOverPolicy cluster attributes. Symantec recommends using the Manual value.
- Add the RVGSharedPri resource to the group configuration.
- Remove the CVMVolDg resource, if it has been configured in your previous configuration. This resource is now part of the RVG service group.
- Specify the service group to depend (online, local, firm) on the RVG service group.

Example of the application group on the secondary site:
group database_grp {
    SystemList = { mercury = 0, jupiter = 1 }
    ClusterList = { clus2 = 0, clus1 = 1 }
    Parallel = 1
    OnlineRetryInterval = 300
    ClusterFailOverPolicy = Manual
    Authority = 1
    AutoStartList = { mercury, jupiter }
}

RVGSharedPri ora_vvr_shpri (
    RvgResourceName = racdata_rvg
    OnlineRetryLimit = 0
)

CFSMount oradata_mnt (
    MountPoint = "/oradata"
    BlockDevice = "/dev/vx/dsk/oradatadg/racdb_vol"
    Critical = 0
)

RVGSharedPri ora_vvr_shpri (
    RvgResourceName = racdata_rvg
    OnlineRetryLimit = 0
)

requires group RVGgroup online local firm
oradata_mnt requires ora_vvr_shpri

8  Save and close the main.cf file.
9  Use the following command to verify the syntax of the
    /etc/VRTSvcs/conf/config/main.cf file:

        # hacf -verify /etc/VRTSvcs/conf/config
10 Stop and restart VCS.

    # hastop -all -force

Wait for port h to stop on all nodes, and then restart VCS with the new configuration on all primary nodes:

    # hastart

11 Verify that VCS brings all resources online. On one node, enter the following command:

    # hagrp -display

The application, RVG, and CVM groups are online on both nodes of the primary site. The RVGLogOwner group is online on one node of the cluster. If either the RVG group or the RVGLogOwner group is partially online, manually bring the groups online using the hagrp -online command. This information applies to the secondary site, except for the application group which must be offline.

12 Verify the service groups and their resources that are brought online. On one node, enter the following command:

    # hagrp -display

The application service group is offline on the secondary site, but the CVM, RVG log owner, and RVG groups are online.

This completes the setup for an SFCFS global cluster using VVR for replication. Symantec recommends testing a global cluster before putting it into production.

Using VCS commands on SFCFS global clusters

For information on the VCS commands for global clusters:

See the Veritas Cluster Server Administrator's Guide.

Using VVR commands on SFCFS global clusters

If you have two SFCFS clusters configured to use VVR for replication, the following administrative functions are available:
Migration of the role of the primary site to the remote site

Takeover of the primary site role by the secondary site

About migration and takeover of the primary site role

Migration is a planned transfer of the role of primary replication host from one cluster to a remote cluster. This transfer enables the application on the remote cluster to actively use the replicated data. The former primary cluster becomes free for maintenance or other activity.

Takeover occurs when an unplanned event (such as a disaster) causes a failure, making it necessary for the applications using the replicated data to be brought online on the remote cluster.

Migrating the role of primary site to the secondary site

After configuring the replication objects within VCS, you can use VCS commands to migrate the role of the cluster on the primary site to the remote cluster. In the procedure below, VCS takes the replicated database service group, database_grp, offline on the primary site and brings it online on the secondary site; the secondary site now assumes the role of the primary site.

Note: The hagrp -switch command cannot migrate a parallel group within a cluster or between clusters in a global cluster environment.
To migrate the role of primary site to the remote site

1. From the primary site, use the following command to take the Oracle service group offline on all nodes.

   ```
   # hagrp -offline database_grp -any
   ```

   Wait for VCS to take all Oracle service groups offline on the primary site.

2. Verify that the RLINK between the primary and secondary is up to date. Use the `vxrlink -g` command with the status option and specify the RLINK for the primary cluster. You can use the command from any node on the primary cluster.

   For example:

   ```
   # vxrlink -g data_disk_group status rlk_clus1_priv_rac1_rvg
   ```

   Where `rlk_clus1_priv_rac1_rvg` is the RLINK.

3. On the secondary site, which is now the new primary site, bring the Oracle service group online on all nodes:

   ```
   # hagrp -online database_grp -any
   ```

Migrating the role of new primary site back to the original primary site

After migrating the role of the primary site to the secondary site, you can use VCS commands to migrate the role of the cluster on the new primary site to the original primary site. In the procedure below, VCS takes the replicated database service group, `database_grp`, offline on the new primary (former secondary) site and brings it online on the original primary site; the original primary site now resumes the role of the primary site.

---

**Note:** The `hagrp -switch` command cannot migrate a parallel group within a cluster or between clusters in a global cluster environment.
To migrate the role of new primary site back to the original primary site

1. Make sure that all CRS resources are online, and switch back the group `database_grp` to the original primary site.

   Issue the following command on the remote site:

   ```
   # hagrp -offline database_grp -any
   ```

2. Verify that the RLINK between the primary and secondary is up to date. Use the `vxrlink -g` command with the status option and specify the RLINK for the primary cluster. You can use the command from any node on the primary cluster.

   For example:

   ```
   # vxrlink -g data_disk_group status rlk_clus1_priv_rac1_rvg
   ```

   Where `rlk_clus1_priv_rac1_rvg` is the RLINK.

3. Make sure that `database_grp` is offline on the new primary site. Then, execute the following command on the original primary site to bring the `database_grp` online:

   ```
   # hagrp -online database_grp -any
   ```

Taking over the primary role by the remote cluster

Takeover occurs when the remote cluster on the secondary site starts the application that uses replicated data. This situation may occur if the secondary site perceives the primary site as dead, or when the primary site becomes inaccessible (perhaps for a known reason). For a detailed description of concepts of taking over the primary role:

See the *Veritas Volume Replicator Administrator’s Guide*.

Before enabling the secondary site to take over the primary role, the administrator on the secondary site must "declare" the type of failure at the remote (primary, in this case) site and designate the failure type using one of the options for the `haclus` command.

Takeover options are:

- **Disaster**
- **Outage**
Disaster

When the cluster on the primary site is inaccessible and appears dead, the administrator declares the failure type as "disaster." For example, fire may destroy a data center, including the primary site and all data in the volumes. After making this declaration, the administrator can bring the service group online on the secondary site, which now has the role as "primary" site.

Outage

When the administrator of a secondary site knows the primary site is inaccessible for a known reason, such as a temporary power outage, the administrator may declare the failure as an "outage." Typically, an administrator expects the primary site to return to its original state.

After the declaration for an outage occurs, the RVGSharedPri agent enables DCM logging while the secondary site maintains the primary replication role. After the original primary site becomes alive and returns to its original state, DCM logging makes it possible to use fast fail back resynchronization when data is resynchronized to the original cluster.

Before attempting to resynchronize the data using the fast fail back option from the current primary site to the original primary site, take the precaution at the original primary site of making a snapshot of the original data. This action provides a valid copy of data at the original primary site for use in the case the current primary site fails before the resynchronization is complete.

See “Examples for takeover and resynchronization” on page 348.

See “Replica” on page 348.

Disconnect

When both clusters are functioning properly and the heartbeat link between the clusters fails, a split-brain condition exists. In this case, the administrator can declare the failure as "disconnect," which means no attempt will occur to take over the role of the primary site at the secondary site. This declaration is merely advisory, generating a message in the VCS log indicating the failure results from a network outage rather than a server outage.
Replica

In the rare case where the current primary site becomes inaccessible while data is resynchronized from that site to the original primary site using the fast fail back method, the administrator at the original primary site may resort to using a data snapshot (if it exists) taken before the start of the fast fail back operation. In this case, the failure type is designated as "replica".

Examples for takeover and resynchronization

The examples illustrate the steps required for an outage takeover and resynchronization.

To take over after an outage

1. From any node of the secondary site, issue the `haclus` command:

   ```
   # haclus -declare outage -clus rac_cluster101
   ```

2. After declaring the state of the remote cluster, bring the Oracle service group online on the secondary site. For example:

   ```
   # hagrp -online -force database_grp -any
   ```
To resynchronize after an outage

1. On the original primary site, create a snapshot of the RVG before resynchronizing it in case the current primary site fails during the resynchronization. Assuming the disk group is `data_disk_group` and the RVG is `rac1_rvg`, type:

   ```bash
   # vxrvg -g data_disk_group -F snapshot rac1_rvg
   ```

   See the *Veritas Volume Replicator Administrator’s Guide* for details on RVG snapshots.

2. Resynchronize the RVG. From the CVM master node of the current primary site, issue the `hares` command and the `-action` option with the `fbsync` action token to resynchronize the RVGSharedPri resource. For example:

   ```bash
   # hares -action ora_vvr_shpri fbsync -sys mercury
   ```

   To determine which node is the CVM master node, type:

   ```bash
   # vxdctl -c mode
   ```

3. Perform one of the following commands, depending on whether the resynchronization of data from the current primary site to the original primary site is successful:

   - If the resynchronization of data is successful, use the `vxrvg` command with the `snapback` option to reattach the snapshot volumes on the original primary site to the original volumes in the specified RVG:

     ```bash
     # vxrvg -g data_disk_group snapback rac1_rvg
     ```

   - A failed attempt at the resynchronization of data (for example, a disaster hits the primary RVG when resynchronization is in progress) could generate inconsistent data. You can restore the contents of the RVG data volumes from the snapshot taken in step 1:

     ```bash
     # vxrvg -g data_disk_group snaprestore rac1_rvg
     ```
Troubleshooting CVM and VVR components of SFCFS

The following topic is useful for troubleshooting the VVR component of SFCFS.

Updating the rlink

If the rlink is not up to date, use the `hares -action` command with the `resync` action token to synchronize the RVG.

The following command example is issued on any node (`galaxy`, in this case) in the primary cluster, specifying the RVGSharedPri resource, `ora_vvr_shpri`:

```
# hares -action ora_vvr_shpri resync -sys galaxy
```

VCS agents to manage wide-area failover

VCS agents now manage external objects that are part of wide-area failover. These objects include replication, DNS updates, and so on. These agents provide a robust framework for specifying attributes and restarts, and can be brought online upon fail over.

VCS provides agents for other array-based or application-based solutions. This section covers the replication agents that is bundled with VVR. See the VCS replication agent documentation for more details.

---

**Note:** See the Veritas Cluster Server Agents for Veritas Volume Replicator Configuration Guide for more information about the RVG and RVGPrimary agents.

---

**Note:** The RVGSnapshot agent is not supported for SFCFS.

---

DNS agent

The DNS agent updates the canonical name-mapping in the domain name server after a wide-area failover. See the Veritas Cluster Server Bundled Agents Reference Guide for more information about the agent.

---

RVG agent

The RVG agent manages the Replicated Volume Group (RVG). Specifically, it brings the RVG online, monitors read-write access to the RVG, and takes the RVG offline. Use this agent when using VVR for replication.
RVGPrimary agent

The RVGPrimary agent attempts to migrate or take over a Secondary to a Primary following an application failover. The agent has no actions associated with the offline and monitor routines.
Uninstallation of Storage Foundation Cluster File System

- Chapter 22. Uninstalling Storage Foundation Cluster File System
Uninstalling Storage Foundation Cluster File System

This chapter includes the following topics:

- Shutting down cluster operations
- Disabling the agents on a system
- Removing the Replicated Data Set
- Uninstalling SFCFS with the Veritas Web-based installer
- Uninstalling SFCFS depots using the script-based installer
- Uninstalling Storage Foundation Cluster File System
- Removing license files (Optional)
- Removing the CP server configuration using the removal script
- Removing the Storage Foundation for Databases (SFDB) repository after removing the product

Shutting down cluster operations

If the systems are running as an HA cluster, you have to take all service groups offline and shutdown VCS.
To take all service groups offline and shutdown VCS

- Use the `hastop` command as follows:

```bash
# /opt/VRTSvcs/bin/hastop -all
```

**Warning:** Do not use the `-force` option when executing `hastop`. This will leave all service groups online and shut down VCS, causing undesired results during uninstallation of the packages.

---

**Disabling the agents on a system**

This section explains how to disable a VCS agent for VVR on a system. To disable an agent, you must change the service group containing the resource type of the agent to an OFFLINE state. Then, you can stop the application or switch the application to another system.

**To disable the agents**

1. Check whether any service group containing the resource type of the agent is online by typing the following command:

```bash
# hagrp -state service_group -sys system_name
```

   If none of the service groups is online, skip to **3**.

2. If the service group is online, take it offline.

   To take the service group offline without bringing it online on any other system in the cluster, enter:

```bash
# hagrp -offline service_group -sys system_name
```
3  Stop the agent on the system by entering:

```bash
# haagent -stop agent_name -sys system_name
```

When you get the message *Please look for messages in the log file, check the file /var/VRTSvcs/log/engine_A.log for a message confirming that each agent has stopped.*

You can also use the `ps` command to confirm that the agent is stopped.

4  Remove the system from the `SystemList` of the service group. If you disable the agent on all the systems in the `SystemList`, you can also remove the service groups and resource types from the VCS configuration.

Read information on administering VCS from the command line.

See the *Veritas Cluster Server User’s Guide.*

**Removing the Replicated Data Set**

If you use VVR, you need to perform the following steps. This section gives the steps to remove a Replicated Data Set (RDS) when the application is either active or stopped.

**To remove the Replicated Data Set**

1  Verify that all RLINKs are up-to-date:

```bash
# vxrlink -g diskgroup status rlink_name
```

If the Secondary is not required to be up-to-date, proceed to 2 and stop replication using the `-f` option with the `vradmin stoprep` command.

2  Stop replication to the Secondary by issuing the following command on any host in the RDS:

The `vradmin stoprep` command fails if the Primary and Secondary RLINKs are not up-to-date. Use the `-f` option to stop replication to a Secondary even when the RLINKs are not up-to-date.

```bash
# vradmin -g diskgroup stoprep local_rvgname sec_hostname
```

The argument `local_rvgname` is the name of the RVG on the local host and represents its RDS.

The argument `sec_hostname` is the name of the Secondary host as displayed in the output of the `vradmin printrvg` command.
3 Remove the Secondary from the RDS by issuing the following command on any host in the RDS:

```bash
# vradmin -g diskgroup delsec local_rvgname sec_hostname
```

The argument `local_rvgname` is the name of the RVG on the local host and represents its RDS.

The argument `sec_hostname` is the name of the Secondary host as displayed in the output of the `vradmin printrvg` command.

4 Remove the Primary from the RDS by issuing the following command on the Primary:

```bash
# vradmin -g diskgroup delpri local_rvgname
```

When used with the `-f` option, the `vradmin delpri` command removes the Primary even when the application is running on the Primary.

The RDS is removed.

Go on to uninstalling Volume Manager to uninstall VVR.

5 If you want to delete the SRLs from the Primary and Secondary hosts in the RDS, issue the following command on the Primary and all Secondaries:

```bash
# vxedit -r -g diskgroup rm srl_name
```

6 Uninstall the VVR packages.

---

**Uninstalling SFCFS with the Veritas Web-based installer**

This section describes how to uninstall Storage Foundation Cluster File System or Storage Foundation Cluster File System High Availability with the Veritas Web-based installer.

**To uninstall SFCFS**

1 Perform the required steps to save any data that you wish to preserve. For example, take back-ups of configuration files.

2 Start the Web-based installer.

   See “Starting the Veritas Web-based installer” on page 67.

3 On the Select a task and a product page, select **Uninstall a Product** from the Task drop-down list.
4 Select Storage Foundation Cluster File System or Storage Foundation Cluster File System High Availability from the Product drop-down list, and click Next.

5 Indicate the systems on which to uninstall. Enter one or more system names, separated by spaces. Click Validate.

6 After the validation completes successfully, click Next to uninstall SFCFS on the selected system.

7 If there are any processes running on the target system, the installer stops the processes. Click Next.

8 After the installer stops the processes, the installer removes the products from the specified system.

Click Next.

9 After the uninstall completes, the installer displays the location of the summary, response, and log files. If required, view the files to confirm the status of the removal.

10 Click Finish.

The Web-based installer prompts you for another task.

Uninstalling SFCFS depots using the script-based installer

Use the following procedure to remove SFCFS products.

Not all depots may be installed on your system depending on the choices that you made when you installed the software.

See “About configuring secure shell or remote shell communication modes before installing products” on page 405.

To shut down and remove the installed SFCFS depots

1 Comment out or remove any Veritas File System (VxFS) entries from the file system table /etc/fstab. Failing to remove these entries could result in system boot problems later.

2 Unmount all mount points for VxFS file systems.

   # umount /mount_point

3 If the VxVM package (VRTSvxvm) is installed, read and follow the uninstallation procedures for VxVM.
4 Stop the VEA Service.
   
   # /opt/VRTS/bin/vxsvcctrl stop

5 Make sure you have performed all of the prerequisite steps.

6 In an HA configuration, stop VCS processes on either the local system or all systems.
   
   To stop VCS processes on the local system:
   
   # hastop -local

   To stop VCS processes on all systems:
   
   # hastop -all

7 Move to the /opt/VRTS/install directory and run the uninstall script.
   
   # cd /opt/VRTS/install

   For Veritas Storage Foundation Cluster File System
   
   # ./uninstallsfcfs

8 The uninstall script prompts for the system name. Enter one or more system names, separated by a space, from which to uninstall SFCFS, for example, host1:

   Enter the system names separated by spaces from which to uninstall Storage Foundation: host1

9 The uninstall script prompts you to select Storage Foundation Cluster File System or Storage Foundation Cluster File System High Availability.

10 The uninstall script prompts you to stop the product processes. If you respond yes, the processes are stopped and the depots are uninstalled.

   The uninstall script creates log files and displays the location of the log files.

11 Most depots have kernel components. In order to ensure complete removal, a system reboot is recommended after all depots have been removed.

Uninstalling Storage Foundation Cluster File System

If you need to uninstall SFCFS software. Use the uninstallssfcfs script.
To uninstall SFCFS HA

1. Log in as superuser.
2. Stop the cluster:
   ```
   # hastop -all
   ```
   Do not use the `hastop -force` command to stop VCS.
3. Change directory to `/opt/VRTS/install`:
   ```
   # cd /opt/VRTS/install
   ```
4. Run the `uninstallSfcfs` command to uninstall SFCFS. The `uninstallSfcfs` script uses `ssh` to communicate with remote nodes as default:
   ```
   # ./uninstallSfcfs
   ```
   If you want to use `rsh` you must specify on the command line:
   ```
   # ./uninstallSfcfs -rsh
   ```
5. Enter the system names to uninstall SFCFS.
   Enter the system names separated by spaces on which to uninstall SFCFS: `system01 system02`
6. Enter `y` to stop the SFCFS process:
   Do you want to stop SFCFS processes now? [y, n, q] (y)
7. After the uninstall completes, the installer displays the location of the log and summary files. If required, view the files to confirm the status of the removal.

Removing license files (Optional)

Optionally, you can remove the license files.
To remove the VERITAS license files

1. To see what license key files you have installed on a system, enter:

   ```
   # /sbin/vxlicrep
   ```

   The output lists the license keys and information about their respective products.

2. Go to the directory containing the license key files and list them:

   ```
   # cd /etc/vx/licenses/lic
   # ls -a
   ```

3. Using the output from step 1, identify and delete unwanted key files listed in step 2. Unwanted keys may be deleted by removing the license key file.

Removing the CP server configuration using the removal script

This section describes how to remove the CP server configuration from a node or cluster hosting the CP server.

**Warning:** Ensure that no SFCFS cluster is using the CP server that will have its CP server configuration removed.

A configuration utility that is part of VRTScps package is used to remove the CP server configuration. When using the configuration utility, a configuration removal script is run and the following tasks are performed:

- All CP server configuration files are removed
- The VCS configuration for CP server is removed

After running the utility and script, you can then uninstall VCS from the node or cluster.

**Note:** The configuration script has to run only once per CP server (which can be on a single node or SFHA cluster), when removing the CP server configuration.

The configuration utility performs the following steps to remove the CP server configuration:

- Takes the the CP server service group (CPSSG) offline, if it is online
Removes the CPSSG service group from the VCS configuration

The following procedure describes how to remove the CP server configuration.

**To remove the CP server configuration**

1. To run the configuration removal script, enter the following command on the node where you want to remove the CP server configuration:

   ```bash
   root@mycps1.symantecexample.com # /opt/VRTScps/bin/configure_cps.pl
   ```

2. The Veritas Coordination Point Server Configuration utility appears with an option menu.

   **VERITAS COORDINATION POINT SERVER CONFIGURATION UTILITY**

   ```
   Select one of the following:
   [1] Configure Coordination Point Server on single node VCS system
   [2] Configure Coordination Point Server on SFHA cluster
   [3] Unconfigure Coordination Point Server
   ```

3. Select option 3 to unconfigure the Coordination Point Server.

4. A warning appears and prompts you to confirm the action to unconfigure the Coordination Point Server.

   Enter "y" to proceed.

   **WARNING:** Unconfiguring Coordination Point Server stops the vxcpser process. VCS clusters using this server for coordination purpose will have one less coordination point.

   Are you sure you want to bring down the cp server? (y/n)
   (Default:n) : y
After entering "y" to proceed, messages appear informing you of the progress in removing the CP server configuration.

When the CP server configuration has been unconfigured, a success message appears.

For an example of the messages from a single node VCS cluster:

A single node VCS cluster is currently configured.
Stopping the CP server ...

Removing the CP Server from VCS configuration..

Removing resource dependencies...
Deleting the resources configured under CPSSG service group...
Deleting the CPSSG service group...

Successfully unconfigured the Veritas Coordination Point Server.

For an example of the messages from a CP server on an SFHA cluster:

A multinode CP Server cluster is currently configured.
Stopping the CP server ...

Removing the CP Server from VCS configuration..

Removing resource dependencies...
Deleting the resources configured under CPSSG service group...
Deleting the CPSSG service group...

Successfully unconfigured the Veritas Coordination Point Server.

You are then prompted to delete the CP server database. Enter "y" to delete the database. For example:

Do you want to delete the CP Server database? (y/n) (Default:n) :

Enter "y" at the prompt to confirm the deletion of the CP server database.

Warning: This database won't be available if CP server is reconfigured on the cluster. Are you sure you want to proceed with the deletion of database? (y/n) (Default:n) :
8 Enter "y" to delete the CP server configuration file and log files. For example:

Do you want to delete the CP Server configuration file (/etc/vxcps.conf) and log files (in /var/VRTScps)? (y/n) (Default:n) : y

9 Run the hagrp -state command to ensure that the CPSSG service group has been removed from the node. For example:

root@mycps1.symantecexample.com # hagrp -state CPSSG

VCS WARNING V-16-1-40131 Group CPSSG does not exist in the local cluster

Removing the Storage Foundation for Databases (SFDB) repository after removing the product

After removing the product, you can remove the SFDB repository file and any backups.

Removing the SFDB repository file will disable the SFDB tools.

To remove the SFDB repository

1 Change directories to the location of the local lookup information for the Oracle SID.

   For example:

   # cd /var/vx/vxdba/$ORACLE_SID

2 Identify the SFDB repository file and any associated links:

   For example:

   # ls -al

   lrwxrwxrwx 1 oracle oinstall 26 Jul 21 13:58 .sfdb_rept -> /ora_data1/TEST/.sfdb_rept

   Follow the symlink of .sfdb_rept.

   # cd /ora_data1/TEST
3 Remove the repository directory containing the repository file and all backups. For example:

```bash
# rm -rf .sfdb_rept
```

4 Remove the local lookup directory for the Oracle SID:

```bash
# cd /var/vx/vxdba
# rm -rf $ORACLE_SID
```

This completes the removal of the SFDB repository.

Installation scripts

This appendix includes the following topics:

■ About installation scripts
■ Installation script options

About installation scripts

Veritas Storage Foundation and High Availability Solutions 5.1 SP1 provides several installation scripts.

An alternative to the installer script is to use a product-specific installation script. If you obtained a Veritas product from an electronic download site, which does not include the installer, use the appropriate product installation script.

The following product installation scripts are available:

Veritas Cluster Server (VCS)                     installvcs
Veritas Storage Foundation (SF)                 installsf
Veritas Storage Foundation and High Availability (SFHA) installsfha
Veritas Storage Foundation Cluster File System (SFCFS) installsfcfs
Veritas Storage Foundation for Oracle RAC (SF Oracle RAC) installsfrac
Symantec Product Authentication Service (AT)    installat
Veritas Dynamic Multi-pathing                   installdmp
To use the installation script, enter the script name at the prompt. For example, to install Veritas Storage Foundation, type `./installsf` at the prompt.

## Installation script options

Table A-1 shows command line options for the installation script. For an initial install or upgrade, options are not usually required. The installation script options apply to all Veritas Storage Foundation product scripts, except where otherwise noted.

See “About installation scripts” on page 369.

### Table A-1 Available command line options

<table>
<thead>
<tr>
<th>Command Line Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>system1 system2...</code></td>
<td>Specifies the systems on which to run the installation options. A system name is required for all options. If not specified, the command prompts for a system name.</td>
</tr>
<tr>
<td><code>-addnode</code></td>
<td>Adds a node to a high availability cluster.</td>
</tr>
<tr>
<td><code>-allpkgs</code></td>
<td>Displays all depots and patches required for the specified product. The depots and patches are listed in correct installation order. The output can be used to create scripts for command line installs, or for installations over a network.</td>
</tr>
<tr>
<td><code>-comcleanup</code></td>
<td>The <code>-comcleanup</code> option removes the ssh or remsh configuration added by installer on the systems. The option is only required when installation routines that performed auto-configuration of ssh or remsh are abruptly terminated.</td>
</tr>
<tr>
<td><code>-configure</code></td>
<td>Configures the product after installation.</td>
</tr>
</tbody>
</table>
### Table A-1

**Available command line options (continued)**

<table>
<thead>
<tr>
<th>Command Line Option</th>
<th>Function</th>
</tr>
</thead>
</table>
| -copyinstallscripts | Use this option when you manually install products and want to use the installation scripts that are stored on the system to perform product configuration, uninstallation, and licensing tasks without the product media. Use this option to copy the installation scripts to an alternate rootpath when you use it with the `-rootpath` option. The following examples demonstrate the usage for this option:

- `./installer -copyinstallscripts`  
  Copies the installation and uninstallation scripts for all products in the release to `/opt/VRTS/install`. It also copies the installation Perl libraries to `/opt/VRTSperl/lib/site_perl/release_name`.

- `./install product_name -copyinstallscripts`  
  Copies the installation and uninstallation scripts for the specified product and any subset products for the product to `/opt/VRTS/install`. It also copies the installation Perl libraries to `/opt/VRTSperl/lib/site_perl/release_name`.

- `./installer -copyinstallscripts -rootpath alt_root_path`  
  The path `alt_root_path` can be a directory like `/rdisk2`. In that case, this command copies installation and uninstallation scripts for all the products in the release to `/rdisk2/opt/VRTS/install`. CPI perl libraries are copied to `/rdisk2/opt/VRTSperl/lib/site_perl/release_name`, where the `release_name` is a string that starts with UXRT and includes the release version with no punctuation. |
<p>| -fencing | Configures I/O fencing in a running cluster. |</p>
<table>
<thead>
<tr>
<th>Command Line Option</th>
<th>Function</th>
</tr>
</thead>
<tbody>
<tr>
<td>–hostfile <em>full_path_to_file</em></td>
<td>Specifies the location of a file that contains a list of hostnames on which to install.</td>
</tr>
<tr>
<td>–ignorepatchreqs</td>
<td>The <em>–ignorepatchreqs</em> option is used to allow installation or upgrading even if the prerequisite depots or patches are missed on the system.</td>
</tr>
<tr>
<td>–install</td>
<td>The <em>–install</em> option is used to install products on systems.</td>
</tr>
<tr>
<td>–installallpkgs</td>
<td>Specifies that all depots are installed.</td>
</tr>
<tr>
<td>–installminpkgs</td>
<td>Specifies that the minimum depot set is installed.</td>
</tr>
<tr>
<td>–installrecpkgs</td>
<td>Specifies that the required depot set is installed.</td>
</tr>
<tr>
<td>–keyfile <em>ssh_key_file</em></td>
<td>Specifies a key file for secure shell (SSH) installs. This option passes <em>–i ssh_key_file</em> to every SSH invocation.</td>
</tr>
<tr>
<td>–license</td>
<td>Registers or updates product licenses on the specified systems.</td>
</tr>
<tr>
<td>–listpatches</td>
<td>The <em>–listpatches</em> option displays product patches in correct installation order.</td>
</tr>
<tr>
<td>–logpath <em>log_path</em></td>
<td>Specifies a directory other than <em>/opt/VRTS/install/logs</em> as the location where installer log files, summary files, and response files are saved.</td>
</tr>
<tr>
<td>–makeresponsefile</td>
<td>The <em>–makeresponsefile</em> generates a response file without doing an actual installation. Text displaying install, uninstall, start, and stop actions are simulations. These actions are not being performed on the system.</td>
</tr>
<tr>
<td>–minpkgs</td>
<td>Displays the minimal depots and patches required for the specified product. The depots and patches are listed in correct installation order. Optional depots are not listed. The output can be used to create scripts for command line installs, or for installations over a network. See <em>allpkgs</em> option.</td>
</tr>
<tr>
<td>Command Line Option</td>
<td>Function</td>
</tr>
<tr>
<td>----------------------</td>
<td>----------</td>
</tr>
<tr>
<td><code>-patchpath patch_path</code></td>
<td>Designates the path of a directory that contains all patches to install. The directory is typically an NFS-mounted location and must be accessible by all specified installation systems.</td>
</tr>
<tr>
<td><code>-pkginfo</code></td>
<td>Displays a list of depots and the order of installation in a human-readable format. This option only applies to the individual product installation scripts. For example, use the <code>-pkginfo</code> option with the <code>installvcs</code> script to display VCS depots.</td>
</tr>
<tr>
<td><code>-pkgpath package_path</code></td>
<td>Designates the path of a directory that contains all depots to install. The directory is typically an NFS-mounted location and must be accessible by all specified installation systems.</td>
</tr>
<tr>
<td><code>-pkgset</code></td>
<td>Discovers and displays the depot group (minimum, recommended, all) and depots that are installed on the specified systems.</td>
</tr>
<tr>
<td><code>-pkgtable</code></td>
<td>Displays product's depots in correct installation order by group.</td>
</tr>
<tr>
<td><code>-postcheck</code></td>
<td>Checks for different HA and file system-related processes, the availability of different ports, and the availability of cluster-related service groups.</td>
</tr>
<tr>
<td><code>-precheck</code></td>
<td>Performs a preinstallation check to determine if systems meet all installation requirements. Symantec recommends doing a precheck before installing a product.</td>
</tr>
<tr>
<td><code>-recpkgs</code></td>
<td>Displays the recommended depots and patches required for the specified product. The depots and patches are listed in correct installation order. Optional depots are not listed. The output can be used to create scripts for command line installs, or for installations over a network. See <code>allpkgs</code> option.</td>
</tr>
<tr>
<td><code>-redirect</code></td>
<td>Displays progress details without showing the progress bar.</td>
</tr>
<tr>
<td>Command Line Option</td>
<td>Function</td>
</tr>
<tr>
<td>---------------------</td>
<td>----------</td>
</tr>
<tr>
<td><strong>-requirements</strong></td>
<td>The <code>-requirements</code> option displays required OS version, required patches, file system space, and other system requirements in order to install the product.</td>
</tr>
<tr>
<td><strong>-responsefile response_file</strong></td>
<td>Automates installation and configuration by using system and configuration information stored in a specified file instead of prompting for information. The <code>response_file</code> must be a full path name. You must edit the response file to use it for subsequent installations. Variable field definitions are defined within the file.</td>
</tr>
<tr>
<td><strong>-rootpath root_path</strong></td>
<td>Specifies an alternative root directory on which to install depots. On HP-UX operating systems, <code>-rootpath</code> passes <code>-I path</code> to <code>swinstall</code>.</td>
</tr>
<tr>
<td><strong>-rsh</strong></td>
<td>Specify this option when you want to use remsh and rcp for communication between systems instead of the default ssh and scp. See &quot;About configuring secure shell or remote shell communication modes before installing products&quot; on page 405.</td>
</tr>
<tr>
<td><strong>-security</strong></td>
<td>Enable or disable Symantec Product Authentication Service in a VCS cluster that is running. You can specify this option with the <code>installvcs</code>, <code>installsfha</code> or <code>installsfcfs</code> scripts. For more information about Symantec Product Authentication Service in a VCS cluster, see the <em>Veritas Cluster Server Installation Guide</em>.</td>
</tr>
<tr>
<td><strong>-serial</strong></td>
<td>Specifies that the installation script performs install, uninstall, start, and stop operations on each system in a serial fashion. If this option is not specified, these operations are performed simultaneously on all systems.</td>
</tr>
<tr>
<td><strong>-start</strong></td>
<td>Starts the daemons and processes for the specified product.</td>
</tr>
<tr>
<td>Command Line Option</td>
<td>Function</td>
</tr>
<tr>
<td>---------------------</td>
<td>--------------------------------------------------------------------------</td>
</tr>
<tr>
<td>--stop</td>
<td>Stops the daemons and processes for the specified product.</td>
</tr>
<tr>
<td>--tmppath tmp_path</td>
<td>Specifies a directory other than /var/tmp as the working directory for the installation scripts. This destination is where initial logging is performed and where depots are copied on remote systems before installation.</td>
</tr>
<tr>
<td>--uninstall</td>
<td>The --uninstall option is used to uninstall products from systems.</td>
</tr>
<tr>
<td>--upgrade</td>
<td>Specifies that an existing version of the product exists and you plan to upgrade it.</td>
</tr>
<tr>
<td>--version</td>
<td>Checks and reports the installed products and their versions. Identifies the installed and missing depots and patches where applicable for the product. Provides a summary that includes the count of the installed and any missing depots and patches where applicable.</td>
</tr>

This appendix includes the following topics:

- About response files
- Installing SFCFS using response files
- Configuring SFCFS using response files
- Upgrading SFCFS using response files
- Uninstalling SFCFS using response files
- Syntax in the response file
- Response file variables to install, upgrade, or uninstall Storage Foundation Cluster File System
- Response file variables to configure Storage Foundation Cluster File System
- Sample response file for SFCFS install
- Sample response file for SFCFS configure

About response files

The installer or product installation script generates a response file during any installation, configuration, upgrade, or uninstall procedure. The response file contains the configuration information that you entered during the procedure. When the procedure completes, the installation script displays the location of the response files.

You can use the response file for future installation procedures by invoking an installation script with the `responsefile` option. The response file passes arguments to the script to automate the installation of that product. You can edit the file to automate installation and configuration of additional systems.
You can generate a response file using the `makeresponsefile` option.

See “Installation script options” on page 370.

Installing SFCFS using response files

Typically, you can use the response file that the installer generates after you perform SFCFS installation on one cluster to install SFCFS on other clusters. You can also create a response file using the `makeresponsefile` option of the installer.

To install SFCFS using response files

1. Make sure the systems where you want to install SFCFS meet the installation requirements.
2. Make sure the preinstallation tasks are completed.
3. Copy the response file to one of the cluster systems where you want to install SFCFS.
4. Edit the values of the response file variables as necessary.
5. Mount the product disc and navigate to the directory that contains the installation program.
6. Start the installation from the system to which you copied the response file. For example:

```
# ./installer -responsefile /tmp/response_file
# ./installsfcfs -responsefile /tmp/response_file
```

Where `/tmp/response_file` is the response file's full path name.

Configuring SFCFS using response files

Typically, you can use the response file that the installer generates after you perform SFCFS configuration on one cluster to configure SFCFS on other clusters. You can also create a response file using the `makeresponsefile` option of the installer.
To configure SFCFS using response files

1. Make sure the SFCFS depots are installed on the systems where you want to configure SFCFS.
2. Copy the response file to one of the cluster systems where you want to configure SFCFS.
3. Edit the values of the response file variables as necessary.
   To configure optional features, you must define appropriate values for all the response file variables that are related to the optional feature.
   See “Response file variables to configure Storage Foundation Cluster File System” on page 383.
4. Start the configuration from the system to which you copied the response file. For example:

   ```
   # /opt/VRTS/install/installSfcfs -responsefile /tmp/response_file
   ```

   Where /tmp/response_file is the response file’s full path name.

Upgrading SFCFS using response files

Typically, you can use the response file that the installer generates after you perform SFCFS upgrade on one cluster to upgrade SFCFS on other clusters. You can also create a response file using the -makeresponsefile option of the installer.

To perform automated SFCFS upgrade

1. Make sure the systems where you want to upgrade SFCFS meet the upgrade requirements.
2. Make sure the pre-upgrade tasks are completed.
3. Copy the response file to one of the cluster systems where you want to upgrade SFCFS.
4. Edit the values of the response file variables as necessary.
Mount the product disk, and navigate to the folder that contains the installation program.

Start the upgrade from the system to which you copied the response file. For example:

```bash
#/installer -responsefile /tmp/response_file
#/installsfcfs -responsefile /tmp/response_file
```

Where /tmp/response_file is the response file’s full path name.

---

**Uninstalling SFCFS using response files**

Typically, you can use the response file that the installer generates after you perform SFCFS uninstallation on one cluster to uninstall SFCFS on other clusters.

**To perform an automated uninstallation**

1. Make sure that you meet the prerequisites to uninstall SFCFS.
2. Copy the response file to one of the cluster systems where you want to uninstall SFCFS.
3. Edit the values of the response file variables as necessary.
4. Start the uninstallation from the system to which you copied the response file. For example:

```
#/opt/VRTS/install/uninstallsfcfs -responsefile /tmp/response_file
```

Where /tmp/response_file is the response file’s full path name.

---

**Syntax in the response file**

The syntax of the Perl statements that are included in the response file variables varies. It can depend on whether the variables require scalar or list values.

For example, in the case of a string value:

```perl
$CFG{Scalar_variable}="value";
```

or, in the case of an integer value:

```perl
$CFG{Scalar_variable}=123;
```

or, in the case of a list:
Response file variables to install, upgrade, or uninstall Storage Foundation Cluster File System

Table B-1 lists the response file variables that you can define to configure SFCFS.

<table>
<thead>

**Response file variables to configure Storage Foundation Cluster File System**

Table B-2 lists the response file variables that you can define to configure Storage Foundation Cluster File System.
<table>
<thead>
<tr>
<th>Variable</th>
<th>List or Scalar</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFG[opt]{configure}</td>
<td>Scalar</td>
<td>Performs the configuration if the depots are already installed. (Required)</td>
</tr>
<tr>
<td>CFG{accepteula}</td>
<td>Scalar</td>
<td>Specifies whether you agree with EULA.pdf on the media. (Required)</td>
</tr>
<tr>
<td>CFG{systems}</td>
<td>List</td>
<td>List of systems on which the product is to be configured. (Required)</td>
</tr>
<tr>
<td>CFG{prod}</td>
<td>Scalar</td>
<td>Defines the product to be configured. (Required)</td>
</tr>
<tr>
<td>CFG[opt]{keyfile}</td>
<td>Scalar</td>
<td>Defines the location of an ssh keyfile that is used to communicate with all remote systems. (Optional)</td>
</tr>
<tr>
<td>CFG[opt]{rsh}</td>
<td>Scalar</td>
<td>Defines that remsh must be used instead of ssh as the communication method between systems. (Optional)</td>
</tr>
<tr>
<td>CFG[opt]{logpath}</td>
<td>Scalar</td>
<td>Mentions the location where the log files are to be copied. The default location is /opt/VRTS/install/logs. (Optional)</td>
</tr>
</tbody>
</table>
Table B-2  Response file variables specific to configuring Storage Foundation Cluster File System (continued)

<table>
<thead>
<tr>
<th>Variable</th>
<th>List or Scalar</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>$CFG{uploadlogs}</td>
<td>Scalar</td>
<td>Defines Boolean value 0 or 1. The value 1 indicates that the installation logs are uploaded to the Symantec Web site. The value 0 indicates that the installation logs are not uploaded to the Symantec Web site. (Optional)</td>
</tr>
</tbody>
</table>

Note that some optional variables make it necessary to define other optional variables. For example, all the variables that are related to the cluster service group (the csgnic, csgvip, and csgnetmask variables) must be defined if any are defined. The same is true for the SMTP notification (the smtpserver, smtprecp, and smtpsrvsev variables), the SNMP trap notification (the snmpport, snmpcons, and snmpcsev variables), and the Global Cluster Option (the gconic, gcovip, and gconetmask variables).

Table B-3 lists the response file variables that specify the required information to configure a basic Storage Foundation Cluster File System cluster.

Table B-3  Response file variables specific to configuring a basic Storage Foundation Cluster File System cluster

<table>
<thead>
<tr>
<th>Variable</th>
<th>List or Scalar</th>
<th>Description</th>
</tr>

Sample response file for SFCFS configure
Configuring I/O fencing using a response file

This appendix includes the following topics:

- Configuring I/O fencing using response files
- Response file variables to configure disk-based I/O fencing
- Sample response file for configuring disk-based I/O fencing
- Response file variables to configure server-based I/O fencing
- Sample response file for configuring server-based I/O fencing
- Response file variables to configure non-SCSI3 server-based I/O fencing
- Sample response file for configuring non-SCSI3 server-based I/O fencing

Configuring I/O fencing using response files

Typically, you can use the response file that the installer generates after you perform I/O fencing configuration to configure I/O fencing for Storage Foundation Cluster File System.

To configure I/O fencing using response files

1. Make sure that Storage Foundation Cluster File System is configured.
2. Based on whether you want to configure disk-based or server-based I/O fencing, make sure you have completed the preparatory tasks.

See “About planning to configure I/O fencing” on page 88.
3 Copy the response file to one of the cluster systems where you want to configure I/O fencing.

See “Sample response file for configuring disk-based I/O fencing” on page 397.

See “Sample response file for configuring server-based I/O fencing” on page 400.

4 Edit the values of the response file variables as necessary.

See “Response file variables to configure disk-based I/O fencing” on page 396.

See “Response file variables to configure server-based I/O fencing” on page 398.

5 Start the configuration from the system to which you copied the response file. For example:

```
# /opt/VRTS/install/installsfcfs -responsefile /tmp/response_file
```

Where /tmp/response_file is the response file’s full path name.

**Response file variables to configure disk-based I/O fencing**

Table C-1 lists the response file variables that specify the required information to configure disk-based I/O fencing for SFCFS.

<table>
<thead>
<tr>
<th>Variable</th>
<th>List or Scalar</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CFG[opt][fencing]</td>
<td>Scalar</td>
<td>Performs the I/O fencing configuration. (Required)</td>
</tr>
</tbody>
</table>
| CFG[vxfen_config_fencing_option] | Scalar | Specifies the I/O fencing configuration mode.  
- 1—Coordination Point Server-based I/O fencing  
- 2—Coordinator disk-based I/O fencing  
- 3—Disabled mode (Required) |
### Table C-1  
Response file variables specific to configuring disk-based I/O fencing

<table>
<thead>
<tr>
<th>Variable</th>
<th>List or Scalar</th>
<th>Description</th>
</tr>
</thead>
</table>
| CFG `{vxfen_config_fencing_mechanism}` | Scalar | Specifies the I/O fencing mechanism.  
This variable is not required if you had configured fencing in disabled mode. For disk-based fencing, you must configure the `vxfen_config_fencing_mechanism` variable and either the `vxfen_config_fencing_dg` variable or the `vxfen_config_fencing_newdg_disks` variable. (Optional) |
| CFG `{vxfen_config_fencing_dg}` | Scalar | Specifies the disk group for I/O fencing. (Optional)  
**Note:** You must define the `vxfen_config_fencing_dg` variable to use an existing disk group. If you want to create a new disk group, you must use both the `vxfen_config_fencing_dg` variable and the `vxfen_config_fencing_newdg_disks` variable. |
| CFG `{vxfen_config_fencing_newdg_disks}` | List | Specifies the disks to use to create a new disk group for I/O fencing. (Optional)  
**Note:** You must define the `vxfen_config_fencing_dg` variable to use an existing disk group. If you want to create a new disk group, you must use both the `vxfen_config_fencing_dg` variable and the `vxfen_config_fencing_newdg_disks` variable. |

### Sample response file for configuring disk-based I/O fencing

Review the disk-based I/O fencing response file variables and their definitions.
See “Response file variables to configure disk-based I/O fencing” on page 396.

```
# # Configuration Values:
#
our %CFG;

$CFG{vcs_clusterid}=13221;
$CFG{vcs_clustername}="clus1";
$CFG{vxfen_config_fencing_dg}="fendg";
$CFG{vxfen_config_fencing_mechanism}="dmp";
$CFG{vxfen_config_fencing_newdg_disks}=
  [ qw(c1t1d0 c2t1d0 c3t1d0) ];
$CFG{vxfen_config_fencing_option}=2;
```

### Response file variables to configure server-based I/O fencing

You can use a CP server response file to configure server-based customized I/O fencing. The installer uses the CP server response file for the following types of I/O fencing configurations:

- **Client cluster fencing (server-based I/O fencing configuration itself)**
  The installer configures server-based customized I/O fencing on the SFCFS cluster without prompting for user input.

- **Disk-based fencing with the disk group already created**
  The installer configures fencing in disk-based mode on the SFCFS cluster without prompting for user input.

  Disk-based fencing configuration is one in which SCSI-3 disks are used as the only coordination points.

  Disk-based fencing with the disk group already created means that the disk group consisting of the coordinating disks already exists on the SFCFS cluster nodes.

- **Disk-based fencing with the disk group to be created**
  The installer creates the disk group and configures fencing properly on all the nodes in the SFCFS cluster without user intervention.
Disk-based fencing with the disk group to be created means that the disk group does not exist yet, but will be created with the disks mentioned as coordination point.

Table C-2 lists the fields in the response file that are relevant for server-based customized I/O fencing.

<table>
<thead>
<tr>
<th>Response file field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>fencing_cpc_config_cpagent</td>
<td>Enter '1' or '0' depending upon whether you want to configure the Coordination Point agent using the installer or not. Enter &quot;0&quot; if you do not want to configure the Coordination Point agent using the installer. Enter &quot;1&quot; if you want to use the installer to configure the Coordination Point agent.</td>
</tr>
<tr>
<td>fencing_cpc_cpagentgrp</td>
<td>Name of the service group which will have the Coordination Point agent resource as part of it. <strong>Note:</strong> This field is obsolete if the <code>fencing_cpc_config_cpagent</code> field is given a value of '0'.</td>
</tr>
<tr>
<td>fencing_cpc_cps</td>
<td>Virtual IP address or Virtual hostname of the CP servers.</td>
</tr>
<tr>
<td>fencing_cpc_reusedg</td>
<td>This response file field indicates whether to reuse an existing DG name for the fencing configuration in customized fencing (CP server and coordinator disks). Enter either a &quot;1&quot; or &quot;0&quot;. Entering a &quot;1&quot; indicates reuse, and entering a &quot;0&quot; indicates do not reuse. When reusing an existing DG name for the mixed mode fencing configuration, you need to manually add a line of text, such as &quot;$CFG[fencing_cpc_reusedg]=0&quot; or &quot;$CFG[fencing_cpc_reusedg]=1&quot; before proceeding with a silent installation.</td>
</tr>
<tr>
<td>fencing_cpc_dgname</td>
<td>The name of the disk group to be used in the customized fencing, where at least one disk is being used.</td>
</tr>
</tbody>
</table>

```
Configuring I/O fencing using a response file

Sample response file for configuring non-SCSI3 server-based I/O fencing
Configuring the secure shell or the remote shell for communications

This appendix includes the following topics:

- About configuring secure shell or remote shell communication modes before installing products
- Configuring and enabling ssh
- Enabling remsh

About configuring secure shell or remote shell communication modes before installing products

Establishing communication between nodes is required to install Veritas software from a remote system, or to install and configure a cluster. The node from which the installer is run must have permissions to run `remsh` (remote shell) or `ssh` (secure shell) utilities. You need to run the installer with superuser privileges on the systems where you plan to install Veritas software.

You can install products to remote systems using either secure shell (`ssh`) or remote shell (`remsh`). Symantec recommends that you use `ssh` as it is more secure than `remsh`.

This section contains an example of how to set up ssh password free communication. The example sets up ssh between a source system (system1) that contains the installation directories, and a target system (system2). This procedure also applies to multiple target systems.
Configuring and enabling ssh

The ssh program enables you to log into and execute commands on a remote system. ssh enables encrypted communications and an authentication process between two untrusted hosts over an insecure network.

In this procedure, you first create a DSA key pair. From the key pair, you append the public key from the source system to the authorized_keys file on the target systems.

Read the ssh documentation and online manual pages before enabling ssh. Contact your operating system support provider for issues regarding ssh configuration.

Visit the OpenSSH website that is located at: http://openssh.org to access online manuals and other resources.

**To create the DSA key pair**

1. On the source system (system1), log in as root, and navigate to the root directory.
   ```
   system1 # cd /
   ```

2. To generate a DSA key pair on the source system, type the following command:
   ```
   system1 # ssh-keygen -t dsa
   ```

   System output similar to the following is displayed:

   Generating public/private dsa key pair.
   Enter file in which to save the key (/home/user/.ssh/id_dsa):

3. Press Enter to accept the default location of `/home/user/.ssh/id_dsa`. 
4  When the program asks you to enter the passphrase, press the Enter key twice.

   Enter passphrase (empty for no passphrase):

   Do not enter a passphrase. Press Enter.

   Enter same passphrase again:

   Press Enter again.

5  Make sure the /.ssh directory is on all the target installation systems (system2 in this example). If that directory is not present, create it on all the target systems and set the write permission to root only:

   system2 # mkdir /.ssh

   Change the permissions of this directory, to secure it.

   system2 # chmod go-w /.ssh

To append the public key from the source system to the authorized_keys file on the target system, using secure file transfer

1  Make sure the secure file transfer program (SFTP) is enabled on all the target installation systems (system2 in this example).

   To enable SFTP, the /opt/ssh/etc/sshd_config file must contain the following two lines:

   PermitRootLogin yes
   Subsystem sftp /opt/ssh/libexec/sftp-server

2  If the lines are not there, add them and restart ssh:

   system1 # /sbin/init.d/secth start
3  From the source system (system1), move the public key to a temporary file on the target system (system2).
Use the secure file transfer program.
In this example, the file name `id_dsa.pub` in the root directory is the name for the temporary file for the public key.
Use the following command for secure file transfer:

```
system1 # sftp system2
```

If the secure file transfer is set up for the first time on this system, output similar to the following lines is displayed:

```
Connecting to system2 ...
The authenticity of host 'system2 (10.182.00.00)' can't be established. DSA key fingerprint is fb:6f:9f:61:91:9d:44:6b:87:86:ef:68:a6:fd:88:7d.
Are you sure you want to continue connecting (yes/no)?
```

4  Enter yes.

Output similar to the following is displayed:

```
Warning: Permanently added 'system2,10.182.00.00' (DSA) to the list of known hosts.
root@system2 password:
```

5  Enter the root password of system2.

6  At the `sftp` prompt, type the following command:

```
sftp> put /.ssh/id_dsa.pub
```

The following output is displayed:

```
Uploading /.ssh/id_dsa.pub to /id_dsa.pub
```

7  To quit the SFTP session, type the following command:

```
sftp> quit
```
To begin the `ssh` session on the target system (system2 in this example), type the following command on system1:

```
system1 # ssh system2
```

Enter the root password of system2 at the prompt:

```
password:
```

After you log in to system2, enter the following command to append the `id_dsa.pub` file to the `authorized_keys` file:

```
system2 # cat /id_dsa.pub >> /.ssh/authorized_keys
```

After the `id_dsa.pub` public key file is copied to the target system (system2), and added to the authorized keys file, delete it. To delete the `id_dsa.pub` public key file, enter the following command on system2:

```
system2 # rm /id_dsa.pub
```

To log out of the `ssh` session, enter the following command:

```
system2 # exit
```

When you install from a source system that is also an installation target, also add the local system `id_dsa.pub` key to the local `authorized_keys` file. The installation can fail if the installation source system is not authenticated.

To add the local system `id_dsa.pub` key to the local `authorized_keys` file, enter the following command:

```
system1 # cat /.ssh/id_dsa.pub >> /.ssh/authorized_keys
```

Run the following commands on the source installation system. If your `ssh` session has expired or terminated, you can also run these commands to renew the session. These commands bring the private key into the shell environment and make the key globally available to the user `root`:

```
system1 # exec /usr/bin/ssh-agent $SHELL
system1 # ssh-add
```

```
Identity added: //./id_dsa
```

This shell-specific step is valid only while the shell is active. You must execute the procedure again if you close the shell during the session.
To verify that you can connect to a target system

1. On the source system (system1), enter the following command:

```
system1 # ssh -l root system2 uname -a
```

where system2 is the name of the target system.

2. The command should execute from the source system (system1) to the target system (system2) without the system requesting a passphrase or password.

3. Repeat this procedure for each target system.

Enabling remsh

Remote shell functionality is enabled automatically after installing HP-UX.

Typically, the only requirement to enable remote installations is to modify the .rhosts file. A separate .rhosts file is in the $HOME directory of each user. You must modify this file for each user who remotely accesses the system using remsh. Each line of the .rhosts file must contain a fully qualified domain name or IP address for each remote system that has access to the local system. For example, if the root user must remotely access system1 from system2, add an entry for system2.companyname.com to the ~/.rhosts file on system1.

```
# echo "system2.companyname.com" >> $HOME/.rhosts
```

After you complete an installation procedure, delete the .rhosts file from each user’s $HOME directory to ensure security:

```
# rm -f $HOME/.rhosts
```

For more information on configuring the remote shell, see the operating system documentation and the remsh(1M) manual page.
Storage Foundation Cluster File System components

This appendix includes the following topics:

- Veritas Storage Foundation Cluster File System installation depots
- Veritas Cluster Server installation depots
- Veritas Cluster File System installation depots
- Veritas Storage Foundation obsolete and reorganized installation depots

Veritas Storage Foundation Cluster File System installation depots

Table E-1 shows the depot name and contents for each English language depot for Veritas Storage Foundation Cluster File System. The table also gives you guidelines for which depots to install based whether you want the minimum, recommended, or advanced configuration.

When you install all Veritas Storage Foundation Cluster File System and Veritas Cluster Server (VCS) depots, the combined functionality is called Veritas Storage Foundation Cluster File System and High Availability.

See “Veritas Cluster Server installation depots” on page 413.
### Table E-1  Veritas Storage Foundation Cluster File System depots

<table>
<thead>
<tr>
<th>depots</th>
<th>Contents</th>
<th>Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>VRTSaslapm</td>
<td>Veritas Array Support Library (ASL) and Array Policy Module (APM) binaries. Required for the support and compatibility of various storage arrays.</td>
<td>Minimum</td>
</tr>
</tbody>
</table>
| VRTSat         | Symantec Product Authentication Service  
|                | Installs the Symantec Product Authentication Service, which provides authentication services to other Symantec products.  
|                | This depot contains a server and client component. The server provides services for a root broker, authentication broker, or both.  
|                | The client allows Symantec products to communicate with the brokers. Required to use Symantec Product Authentication Service. | All           |
| VRTSperl       | Perl 5.10.0 for Veritas                                                                                                                  | Minimum       |
| VRTSvlic       | Veritas License Utilities  
|                | Installs the license key layout files required to decode the Storage Foundation license keys. Provides the standard license key utilities vxlicrep, vxlicinst, and vxlictest. | Minimum       |
| VRTSvxfs       | Veritas File System binaries. Required for VxFS file system support.                                                                       | Minimum       |
| VRTSvxvm       | Veritas Volume Manager binaries                                                                                                          | Minimum       |

Veritas Storage Foundation Cluster File System components

Veritas Storage Foundation obsolete and reorganized installation depots
Storage Foundation Cluster File System components

Veritas Storage Foundation obsolete and reorganized installation depots
High availability agent information

This appendix includes the following topics:

- About agents
- Enabling and disabling intelligent resource monitoring
- CVMCluster agent
- CVMVxconfigd agent
- CVMVolDg agent
- CFSMount agent
- CFSfsckd agent

About agents

An agent is defined as a process that starts, stops, and monitors all configured resources of a type, and reports their status to Veritas Cluster Server (VCS). Agents have both entry points and attributes. Entry points are also known as agent functions and are referred to as "agent functions" throughout the document.

Attributes contain data about the agent. An attribute has a definition and a value. You change attribute values to configure resources, which are defined as the individual components that work together to provide application services to the public network. For example, a resource may be a physical component such as a disk or a network interface card, a software component such as Oracle or a Web server, or a configuration component such as an IP address or mounted file system.
Attributes are either optional or required, although sometimes the attributes that are optional in one configuration may be required in other configurations. Many optional attributes have predefined or default values, which you should change as required. A variety of internal use only attributes also exist. Do not modify these attributes—modifying them can lead to significant problems for your clusters. Attributes have type and dimension. Some attribute values can accept numbers, others can accept alphanumeric values or groups of alphanumeric values, while others are simple boolean on/off values.

The entry points and attributes for each SFCFS agent are described in this appendix.

**VCS agents included within SFCFS**

SFCFS includes the following VCS agents:

- CVMCluster agent
- CVMVxconfigd agent
- CVMVolDg agent
- CFSMount agent
- CFSfsckd
- Coordination Point agent

An SFCFS installation automatically configures the CVMCluster resource and the CVMVxconfigd resource.

You must configure the CVMVolDg agent for each shared disk group. If the database uses cluster file systems, configure the CFSMount agent for each volume in the disk group.

Use the information in this appendix about the entry points and attributes of the listed agents to make necessary configuration changes. For information on how to modify the VCS configuration:

See the *Veritas Cluster Server Administrator’s Guide*

**Enabling and disabling intelligent resource monitoring**

Review the following procedures to enable or disable intelligent resource monitoring. The intelligent resource monitoring feature is disabled by default. The IMF resource type attribute determines whether an IMF-aware agent must perform intelligent resource monitoring.
To enable intelligent resource monitoring

1. Make the VCS configuration writable.
   ```
   # haconf -makerw
   ```

2. Run the following command to enable intelligent resource monitoring.
   - To enable intelligent monitoring of offline resources:
     ```
     hatype -modify resource_type IMF -update Mode 1
     ```
   - To enable intelligent monitoring of online resources:
     ```
     hatype -modify resource_type IMF -update Mode 2
     ```
   - To enable intelligent monitoring of both online and offline resources:
     ```
     hatype -modify resource_type IMF -update Mode 3
     ```

3. Change the values of the MonitorFreq key and the RegisterRetryLimit key of the IMF attribute.
   Review the agent-specific recommendations in the attribute definition tables to set these attribute key values.
   See “Attribute definition for CVMVxconfigd agent” on page 426.
   See “Attribute definition for CFSMount agent” on page 434.
   See “Attribute definition for CFSfsckd agent” on page 441.

4. Save the VCS configuration.
   ```
   # haconf -dump -makero
   ```

5. Make sure that the AMF kernel driver is configured on all nodes in the cluster.
   ```
   /sbin/init.d/amf status
   ```
   Configure the AMF driver if the command output returns that the AMF driver is not loaded or not configured.
   See “Administering the AMF kernel driver” on page 422.

6. Restart the agent. Run the following commands on each node.
   ```
   haagent -stop agent_name -force -sys sys_name
   haagent -start agent_name -sys sys_name
   ```
To disable intelligent resource monitoring

1. Make the VCS configuration writable.
   
   ```bash
   # haconf -makerw
   ```

2. To disable intelligent resource monitoring for all the resources of a certain type, run the following command:
   
   ```bash
   hatype -modify resource_type IMF -update Mode 0
   ```

3. To disable intelligent resource monitoring for a specific resource, run the following command:
   
   ```bash
   hares -override resource_name IMF
   hares -modify resource_name IMF -update Mode 0
   ```

4. Save the VCS configuration.
   
   ```bash
   # haconf -dump -makero
   ```

Administering the AMF kernel driver

Review the following procedures to start or stop the AMF kernel driver:

To start the AMF kernel driver

1. Set the value of the AMF_START variable to 1 in the following file:
   
   `/etc/rc.config.d/amf`

2. Start the AMF kernel driver. Run the following command:
   
   `/sbin/init.d/amf start`

To stop the AMF kernel driver

1. Stop the AMF kernel driver. Run the following command:
   
   `/sbin/init.d/amf stop`

2. Set the value of the AMF_START variable to 0 in the following file:
   
   `/etc/rc.config.d/amf`
CVMCluster agent

The CVMCluster agent controls system membership on the cluster port that is associated with Veritas Volume Manager (VxVM).

The CVMCluster agent performs the following functions:

- Joins a node to the CVM cluster port.
- Removes a node from the CVM cluster port.
- Monitors the node's cluster membership state.

Entry points for CVMCluster agent

Table F-1 describes the entry points used by the CVMCluster agent.

<table>
<thead>
<tr>
<th>Entry Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online</td>
<td>Joins a node to the CVM cluster port. Enables the Volume Manager cluster functionality by automatically importing the shared disk groups.</td>
</tr>
<tr>
<td>Offline</td>
<td>Removes a node from the CVM cluster port.</td>
</tr>
<tr>
<td>Monitor</td>
<td>Monitors the node’s CVM cluster membership state.</td>
</tr>
</tbody>
</table>

Attribute definition for CVMCluster agent

Table F-2 describes the user-modifiable attributes of the CVMCluster resource type.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVMClustName</td>
<td>string-scalar</td>
<td>Name of the cluster.</td>
</tr>
<tr>
<td>CVMNodeAddr</td>
<td>string-association</td>
<td>List of host names and IP addresses.</td>
</tr>
<tr>
<td>CVMNodeId</td>
<td>string-association</td>
<td>Associative list. The first part names the system; the second part contains the LLT ID number for the system.</td>
</tr>
</tbody>
</table>
Table F-2  CVMCluster agent attributes (continued)

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVMTTransport</td>
<td>string-scalar</td>
<td>Specifies the cluster messaging mechanism. Default = gab</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note</strong>: Do not change this value.</td>
</tr>
<tr>
<td>PortConfigd</td>
<td>integer-scalar</td>
<td>The port number that is used by CVM for vxconfigd-level communication.</td>
</tr>
<tr>
<td>PortKmsgd</td>
<td>integer-scalar</td>
<td>The port number that is used by CVM for kernel-level communication.</td>
</tr>
<tr>
<td>CVMTimeout</td>
<td>integer-scalar</td>
<td>Timeout in seconds used for CVM cluster reconfiguration. Default = 200</td>
</tr>
</tbody>
</table>

CVMCluster agent type definition

The following type definition is included in the file, *CVMTypes.cf*:

```plaintext
type CVMCluster {
    static int InfoTimeout = 0
    static int NumThreads = 1
    static int OnlineRetryLimit = 2
    static int OnlineTimeout = 400
    static str ArgList[] = { CVMTTransport, CVMClustName, CVMNodeAddr, CVMNodeId, PortConfigd, PortKmsgd, CVMTimeout }
    NameRule = ""
    str CVMClustName
    str CVMMNodeAddr{}
    str CVMMNodeId{}
    str CVMTTransport
    int PortConfigd
    int PortKmsgd
    int CVMTimeout
}
```

**Note:** The attributes CVMNodeAddr, PortConfigd, and PortKmsgd are not used in an SFCFS environment. GAB, the required cluster communication messaging mechanism, does not use them.
CVMCluster agent sample configuration

The following is an example definition for the CVMCluster service group:

```
CVMCluster cvm_clus {
    Critical = 0
    CVMClustName = clus1
    CVMNodeId = { galaxy = 0, nebula = 1 }
    CVMTransport = gab
    CVMTTimeout = 200
}
```

CVMVxconfigd agent

The CVMVxconfigd agent starts and monitors the vxconfigd daemon. The vxconfigd daemon maintains disk and disk group configurations, communicates configuration changes to the kernel, and modifies the configuration information that is stored on disks. CVMVxconfigd must be present in the CVM service group.

The CVMVxconfigd agent is an OnOnly agent; the agent starts the resource when the cluster starts up and VCS restarts the resource when necessary. The Operations attribute specifies these default aspects of startup.

Symantec recommends starting the vxconfigd daemon with the `syslog` option, which enables logging of debug messages. Note that the SFCFS installation configures the `syslog` option for the CVMVxconfigd agent.

This agent is IMF-aware and uses asynchronous monitoring framework (AMF) kernel driver for IMF notification. For more information about the Intelligent Monitoring Framework (IMF) and intelligent resource monitoring, refer to the Veritas Cluster Server Administrator's Guide.

Entry points for CVMVxconfigd agent

Table F-3 describes the entry points for the CVMVxconfigd agent.

<table>
<thead>
<tr>
<th>Entry Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online</td>
<td>Starts the <code>vxconfigd</code> daemon</td>
</tr>
<tr>
<td>Offline</td>
<td>N/A</td>
</tr>
<tr>
<td>Monitor</td>
<td>Monitors whether <code>vxconfigd</code> daemon is running</td>
</tr>
</tbody>
</table>
### Table F-3  CVMxconfigd entry points (continued)

<table>
<thead>
<tr>
<th>Entry Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>imf_init</td>
<td>Initializes the agent to interface with the AMF kernel module. This function runs when the agent starts up.</td>
</tr>
<tr>
<td>imf_getnotification</td>
<td>Gets notification about the vxconfigd process state. This function runs after the agent initializes with the AMF kernel module. This function continuously waits for notification. If the vxconfigd process fails, the function initiates a traditional CVMxconfigd monitor entry point.</td>
</tr>
<tr>
<td>imf_register</td>
<td>Registers or unregisters the vxconfigd process id (pid) with the AMF kernel module. This function runs after the resource goes into steady online state.</td>
</tr>
</tbody>
</table>

### Attribute definition for CVMxconfigd agent

Table F-4 describes the modifiable attributes of the CVMxconfigd resource type.

### Table F-4  CVMxconfigd agent attribute

<td>integer-association</td>
<td>CVMVxconfigd agent</td>
</tr>
</tbody>
</table>
This resource-type level attribute determines whether the CVMVxconfigd agent must perform intelligent resource monitoring. You can also override the value of this attribute at resource-level.

This attribute includes the following keys:

- **Mode**: Define this attribute to enable or disable intelligent resource monitoring.
  - Valid values are as follows:
    - 0—Does not perform intelligent resource monitoring
    - 2—Performs intelligent resource monitoring for online resources and performs poll-based monitoring for offline resources
  - Default: 0
- **MonitorFreq**: This key value specifies the frequency at which the agent invokes the monitor agent function. The value of this key is an integer.
  - Default: 1
  - You can set this key to a non-zero value for cases where the agent requires to perform both poll-based and intelligent resource monitoring. If the value is 0, the agent does not perform poll-based process check monitoring.

  After the resource registers with the AMF kernel driver, the agent calls the monitor agent function as follows:
  - After every \((\text{MonitorFreq} \times \text{MonitorInterval})\) number of seconds for online resources
  - After every \((\text{MonitorFreq} \times \text{OfflineMonitorInterval})\) number of seconds for offline resources

- **RegisterRetryLimit**: If you enable intelligent resource monitoring, the agent invokes the oracle_imf_register agent function to register the resource with the AMF kernel driver. The value of the
### Table F-4  
CVMVxconfigd agent attribute (continued)

<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RegisterRtyLimit key determines the number of times the agent must retry registration for a resource. If the agent cannot register the resource within the limit that is specified, then intelligent monitoring is disabled until the resource state changes or the value of the Mode key changes. Default: 3. For more details of IMF attribute for the agent type, refer to the Veritas Cluster Server Administrator’s Guide.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

---

### CVMVxconfigd agent type definition

The following type definition is included in the CVMTypes.cf file:

```c

type CVMVxconfigd (  
    static int FaultOnMonitorTimeouts = 2  
    static int RestartLimit = 5  
    static str ArgList[] { CVMVxconfigdArgs }  
    static str Operations = OnOnly  
    keylist CVMVxconfigdArgs  
)
```

---

### CVMVxconfigd agent sample configuration

The following is an example definition for the CVMVxconfigd resource in the CVM service group:

```c

CVMVxconfigd cvm_vxconfigd (  
    Critical = 0  
    CVMVxconfigdArgs = { syslog }  
)
```

---

### CVMVolDg agent

The CVMVolDg agent manages the CVM disk groups and CVM volumes and volume sets within the disk groups by performing the following functions:
- Imports the shared disk group from the CVM master node
- Starts the volumes and volume sets in the disk group
- Monitors the disk group, volumes, and volume sets
- Optionally, deports the disk group when the dependent applications are taken offline. The agent deports the disk group only if the appropriate attribute is set.

Configure the CVMVolDg agent for each disk group used by a Oracle service group. A disk group must be configured to only one Oracle service group. If cluster file systems are used for the database, configure the CFSMount agent for each volume or volume set in the disk group.

**Entry points for CVMVolDg agent**

Table F-5 describes the entry points used by the CVMVolDg agent.

<table>
<thead>
<tr>
<th>Entry Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Online</strong></td>
<td>Imports the shared disk group from the CVM master node, if the disk group is not already imported.</td>
</tr>
<tr>
<td></td>
<td>Starts all volumes and volume sets in the shared disk group specified by the CVMVolume attribute.</td>
</tr>
<tr>
<td></td>
<td>Sets the disk group activation mode to shared-write if the value of the CVMActivation attribute is sw. You can set the activation mode on both slave and master systems.</td>
</tr>
<tr>
<td><strong>Offline</strong></td>
<td>Removes the temporary files created by the online entry point.</td>
</tr>
<tr>
<td></td>
<td>If the CVMDeportOnOffline attribute is set to 1 and if the shared disk group does not contain open volumes on any node in the cluster, the disk group is deported from the CVM master node.</td>
</tr>
<tr>
<td>Entry Point</td>
<td>Description</td>
</tr>
<tr>
<td>-------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Monitor</td>
<td>Determines whether the disk group, the volumes, and the volume sets are online. The agent takes a volume set offline if the file system metadata volume of a volume set is discovered to be offline in a monitor cycle. <strong>Note:</strong> If the CFSMount resource goes offline and the file system on the volume set is unmounted, the agent retains the online state of the volume set even if the file system metadata volume in the volume set is offline. This is because the CVMVolDg agent is unable to determine whether or not the volumes that are offline are metadata volumes.</td>
</tr>
<tr>
<td>Clean</td>
<td>Removes the temporary files created by the online entry point.</td>
</tr>
</tbody>
</table>

Attribute definition for CVMVolDg agent

Table F-6 describes the user-modifiable attributes of the CVMVolDg resource type.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CVMDiskGroup (required)</td>
<td>string-scalar</td>
<td>Shared disk group name.</td>
</tr>
<tr>
<td>CVMVolume (required)</td>
<td>string-keylist</td>
<td>Name of shared volumes or volume sets. This list is used to check that the volumes or volume sets are in the correct state before allowing the resource to come online, and that the volumes remain in an enabled state.</td>
</tr>
<tr>
<td>CVMActivation (required)</td>
<td>string-scalar</td>
<td>Activation mode for the disk group. Default = sw (shared-write) This is a localized attribute.</td>
</tr>
<tr>
<td>Attribute</td>
<td>Dimension</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>CVMVolumeIoTest(optional)</td>
<td>string-keylist</td>
<td>List of volumes and volume sets that will be periodically polled to test availability. The polling is in the form of 4 KB reads every monitor cycle to a maximum of 10 of the volumes or volume sets in the list. For volume sets, reads are done on a maximum of 10 component volumes in each volume set.</td>
</tr>
<tr>
<td>CVMDeportOnOffline (optional)</td>
<td>integer-scalar</td>
<td>Indicates whether or not the shared disk group must be deported when the last online CVMVolDg resource for a disk group is taken offline. The value 1 indicates that the agent will deport the shared disk group from the CVM master node, if not already deported, when the last online CVMVolDg resource for the disk group is taken offline. The value 0 indicates that the agent will not deport the shared disk group when the CVMVolDg resource is taken offline. The default value is set to 0. <strong>Note</strong>: If multiple CVMVolDg resources are configured for a shared disk group, set the value of the attribute to either 1 or 0 for all of the resources. The CVM disk group is deported based on the order in which the CVMVolDg resources are taken offline. If the CVMVolDg resources in the disk group contain a mixed setting of 1 and 0 for the CVMDeportOnOffline attribute, the disk group is deported only if the attribute value is 1 for the last CVMVolDg resource taken offline. If the attribute value is 0 for the last CVMVolDg resource taken offline, the disk group is not deported. The deport operation fails if the shared disk group contains open volumes.</td>
</tr>
</tbody>
</table>
CVMVolDg agent type definition

The CVMTypes.cf file includes the CVMVolDg type definition:

```c
type CVMVolDg {
    static keylist RegList = { CVMActivation, CVMVolume }
    static int OnlineRetryLimit = 2
    static int OnlineTimeout = 400
    static str ArgList[] = { CVMDiskGroup, CVMVolume, CVMActivation,
                             CVMVolumeIoTest, CVMDGAction, CVMDeportOnOffline }
    str CVMDiskGroup
    str CVMDGAction
    keylist CVMVolume
    str CVMActivation
    keylist CVMVolumeIoTest
    int CVMDeportOnOffline
    temp int voldg_stat
}
```

CVMVolDg agent sample configuration

Each Oracle service group requires a CVMVolDg resource type to be defined. The following is a sample configuration:

```c
CVMVolDg cvmvoldg1 {
    Critical = 0
    CVMDiskgroup = testdg
    CVMVolume = { vol1, vol2, mvol1, mvol2, snapvol, vset1 }
    CVMVolumeIoTest = { snapvol, vset1 }
    CVMActivation @system1 = sw
    CVMActivation @system2 = sw
    CVMDeportOnOffline = 1
}
```

CFSMount agent

The CFSMount agent brings online, takes offline, and monitors a cluster file system mount point.

The agent executable is located in /opt/VRTSvcs/bin/CFSMount/CFSMountAgent.

The CFSMount type definition is described in the /etc/VRTSvcs/conf/config/CFSTypes.cf file.
This agent is IMF-aware and uses asynchronous monitoring framework (AMF) kernel driver for IMF notification. For more information about the Intelligent Monitoring Framework (IMF) and intelligent resource monitoring, refer to the *Veritas Cluster Server Administrator's Guide*.

**Entry points for CFSMount agent**

Table F-7 provides the entry points for the CFSMount agent.

<table>
<thead>
<tr>
<th>Entry Point</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online</td>
<td>Mounts a block device in cluster mode.</td>
</tr>
<tr>
<td>Offline</td>
<td>Unmounts the file system, forcing unmount if necessary, and sets primary to secondary if necessary.</td>
</tr>
<tr>
<td>Monitor</td>
<td>Determines if the file system is mounted. Checks mount status using the <code>fsclustadm</code> command.</td>
</tr>
<tr>
<td>Clean</td>
<td>Generates a null operation for a cluster file system mount.</td>
</tr>
<tr>
<td>imf_init</td>
<td>Initializes the agent to interface with the AMF kernel driver, which is the IMF notification module for the agent. This function runs when the agent starts up.</td>
</tr>
<tr>
<td>imf_getnotification</td>
<td>Gets notification about resource state changes. This function runs after the agent initializes with the AMF kernel module. This function continuously waits for notification and takes action on the resource upon notification.</td>
</tr>
<tr>
<td>imf_register</td>
<td>Registers or unregisters resource entities with the AMF kernel module. This function runs for each resource after the resource goes into steady state (online or offline).</td>
</tr>
</tbody>
</table>

**Attribute definition for CFSMount agent**

Table F-8 lists user-modifiable attributes of the CFSMount Agent resource type.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MountPoint</td>
<td>string-scalar</td>
<td>Directory for the mount point.</td>
</tr>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>Resource-type level attribute that determines whether the CFSMount agent must perform intelligent resource monitoring. You can also override the value of this attribute at resource-level. This attribute includes the following keys:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ Mode: Define this attribute to enable or disable intelligent resource monitoring. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 0—Does not perform intelligent resource monitoring</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 1—Performs intelligent resource monitoring for offline resources and performs poll-based monitoring for online resources</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 2—Performs intelligent resource monitoring for online resources and performs poll-based monitoring for offline resources</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ 3—Performs intelligent resource monitoring for both online and for offline resources</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Default: 0</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ MonitorFreq: This key value specifies the frequency at which the agent invokes the monitor agent function. The value of this key is an integer. Default: 1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can set this key to a non-zero value for cases where the agent requires to perform both poll-based and intelligent resource monitoring. If the value is 0, the agent does not perform poll-based process check monitoring.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>After the resource registers with the AMF kernel driver, the agent calls the monitor agent function as follows:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>■ After every (MonitorFreq x MonitorInterval) number of seconds for online resources</td>
</tr>
</tbody>
</table>
### Table F-8  
**CFSMount Agent attributes (continued)**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>MountOpt</td>
<td>string-scalar</td>
<td>Options for the mount command. To create a valid MountOpt attribute string:&lt;br&gt;&lt;ul&gt;&lt;li&gt;Use the VxFS type-specific options only.&lt;/li&gt;&lt;li&gt;Do not use the -o flag to specify the VxFS-specific options.&lt;/li&gt;&lt;li&gt;Do not use the -F vxfs file system type option.&lt;/li&gt;&lt;li&gt;Be aware the cluster option is not required.&lt;/li&gt;&lt;li&gt;Specify options in comma-separated list:&lt;br&gt;  - ro&lt;br&gt;  - ro,cluster&lt;br&gt;  - blkclear, mincache=closesync&lt;/li&gt;&lt;/ul&gt;</td>
</tr>
<tr>
<td>Policy</td>
<td>string-scalar</td>
<td>List of nodes to assume the primaryship of the cluster file system if the primary fails. If set to NULL or if none of the hosts specified in the list is active when the primary fails, a node is randomly selected from the set of active nodes to assume primaryship.</td>
</tr>
</tbody>
</table>
Table F-8: CFSMount Agent attributes (continued)

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Dimension</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary (Not set by user)</td>
<td>string-scalar</td>
<td>Information only. Stores the primary node name for a VxFS file system. The value is automatically modified in the configuration file when an unmounted file system is mounted or another node becomes the primary node. The user does not set this attribute and user programs do not rely on this attribute.</td>
</tr>
</tbody>
</table>

CFSMount agent type definition

The `CFSTypes.cf` file includes the CFSMount agent type definition:

```plaintext
type CFSMount {
    static keylist RegList = { MountOpt, Policy, NodeList, ForceOff, SetPrimary }
    static keylist SupportedActions = { primary }
    static int FaultOnMonitorTimeouts = 1
    static int OnlineWaitLimit = 1
    static str ArgList[] = { MountPoint, BlockDevice, MountOpt, Primary, AMFMountType }
    str MountPoint
    str MountType
    str BlockDevice
    str MountOpt
    keylist NodeList
    keylist Policy
    temp str Primary
    str SetPrimary
    temp str RemountRes
    temp str AMFMountType
    str ForceOff
}
```

CFSMount agent sample configuration

Each Oracle service group requires a CFSMount resource type to be defined:

```plaintext
CFSMount ora_mount {
    MountPoint = "/oradata"
    BlockDevice = "/dev/vx/dsk/oradatadg/oradatavol1"
    Primary = nebula;
}
```
To see CFSMount defined in a more extensive example:

**CFSfsckd agent**

The CFSfsckd agent starts, stops, and monitors the vxfsckd process. The CFSfsckd agent executable is /opt/VRTSvcs/bin/CFSfsckd/CFSfsckdAgent. The type definition is in the /etc/VRTSvcs/conf/config/CFSTypes.cf file. The configuration is added to the main.cf file after running the cfscluster config command.

This agent is IMF-aware and uses asynchronous monitoring framework (AMF) kernel driver for IMF notification. For more information about the Intelligent Monitoring Framework (IMF) and intelligent resource monitoring, refer to the *Veritas Cluster Server Administrator's Guide*.

**Entry points for CFSfsckd agent**

Table F-9 describes the CFSfsckd agent entry points.

<table>
<thead>
<tr>
<th>Entry Points</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Online</td>
<td>Starts the vxfsckd process.</td>
</tr>
<tr>
<td>Offline</td>
<td>Kills the vxfsckd process.</td>
</tr>
<tr>
<td>Monitor</td>
<td>Checks whether the vxfsckd process is running.</td>
</tr>
<tr>
<td>Clean</td>
<td>A null operation for a cluster file system mount.</td>
</tr>
<tr>
<td>imf_init</td>
<td>Initializes the agent to interface with the AMF kernel driver, which is the IMF notification module for the agent. This function runs when the agent starts up.</td>
</tr>
<tr>
<td>imf_getnotification</td>
<td>Gets notification about resource state changes. This function runs after the agent initializes with the AMF kernel module. This function continuously waits for notification and takes action on the resource upon notification.</td>
</tr>
<tr>
<td>imf_register</td>
<td>Registers or unregisters resource entities with the AMF kernel module. This function runs for each resource after the resource goes into steady state (online or offline).</td>
</tr>
</tbody>
</table>
Attribute definition for CFSfsckd agent

Table F-10 lists user-modifiable attributes of the CFSfsckd Agent resource type.
### Table F-10: CFSfsckd Agent attributes

<tr>
<td>RegisterRetryLimit: If you enable intelligent resource monitoring, the agent invokes the oracle_imf_register agent function to register the resource with the AMF kernel driver. The value of the RegisterRetryLimit key determines the number of times the agent must retry registration for a resource. If the agent cannot register the resource within the limit that is specified, then intelligent monitoring is disabled until the resource state changes or the value of the Mode key changes. Default: 3.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

See “Enabling and disabling intelligent resource monitoring” on page 420.

---

### CFSfsckd agent type definition

The CFSfsckd type definition:

```c
type CFSfsckd {
    static int RestartLimit = 1
    str ActivationMode{}
}
```

### CFSfsckd agent sample configuration

This is a sample of CFSfsckd configuration:

```c
CFSfsckd vxfsckd {
}
```
This appendix includes the following topics:

- Restarting the installer after a failed connection
- What to do if you see a licensing reminder
- Storage Foundation Cluster File System installation issues
- Storage Foundation Cluster File System problems
- Upgrading Veritas Storage Foundation for Databases (SFDB) tools from 5.0MP2 to 5.1SP1 (2003131)

**Restarting the installer after a failed connection**

If an installation is killed because of a failed connection, you can restart the installer to resume the installation. The installer detects the existing installation. The installer prompts you whether you want to resume the installation. If you resume the installation, the installation proceeds from the point where the installation failed.

**What to do if you see a licensing reminder**

In this release, you can install without a license key. In order to comply with the End User License Agreement, you must either install a license key or make the host managed by a Management Server. If you do not comply with these terms within 60 days, the following warning messages result:
WARNING V-365-1-1 This host is not entitled to run Veritas Storage Foundation/Veritas Cluster Server. As set forth in the End User License Agreement (EULA) you must complete one of the two options set forth below. To comply with this condition of the EULA and stop logging of this message, you have <nn> days to either:
- make this host managed by a Management Server (see http://go.symantec.com/sfhakeyless for details and free download), or
- add a valid license key matching the functionality in use on this host using the command 'vxlicinst'

To comply with the terms of the EULA, and remove these messages, you must do one of the following within 60 days:

■ Install a valid license key corresponding to the functionality in use on the host.
  See “Installing Veritas product license keys” on page 54.
  After you install the license key, you must validate the license key using the following command:

  # vxkeyless display

■ Continue with keyless licensing by managing the server or cluster with a management server.
  For more information about keyless licensing, see the following URL:
  http://go.symantec.com/sfhakeyless

Storage Foundation Cluster File System installation issues

If you encounter any issues installing SFCFS, refer to the following paragraphs for typical problems and their solutions:

Incorrect permissions for root on remote system

The permissions are inappropriate. Make sure you have remote root access permission on each system to which you are installing.

Checking ssh communication with system01 ............ permission denied installer requires that ssh commands used between systems execute without prompting for passwords or confirmations. Please run installer again with the ssh configured for password free logins, or configure rsh and use the -rsh option.
Failed to setup rsh communication on 10.198.89.241: 'rsh 10.198.89.241 <command>' failed
Trying to setup ssh communication on 10.198.89.241. Failed to setup ssh communication on 10.198.89.241: Login denied

Failed to login to remote system(s) 10.198.89.241.
Please make sure the password(s) are correct and superuser(root) can login to the remote system(s) with the password(s).
If you want to setup rsh on remote system(s), please make sure rsh with command argument ('rsh <host> <command>') is not denied by remote system(s).

Either ssh or rsh is needed to be setup between the local node and 10.198.89.241 for communication.

Would you like the installer to setup ssh/rsh communication automatically between the nodes?
Superuser passwords for the systems will be asked. [y,n,q] (y) n

System verification did not complete successfully

The following errors were discovered on the systems:

The ssh permission denied on 10.198.89.241
rsh exited 1 on 10.198.89.241
either ssh or rsh is needed to be setup between the local node and 10.198.89.241 for communication

Suggested solution: You need to set up the systems to allow remote access using ssh or rsh.

See “About configuring secure shell or remote shell communication modes before installing products” on page 405.

Note: Remove remote shell permissions after completing the SFCFS installation and configuration.

Resource temporarily unavailable

If the installation fails with the following error message on the console:
fork() failed: Resource temporarily unavailable

The value of nkthread tunable parameter may not be large enough. The nkthread tunable requires a minimum value of 600 on all systems in the cluster. To determine the current value of nkthread, enter:

```
# kctune -q nkthread
```

If necessary, you can change the value of nkthread using the SAM (System Administration Manager) interface, or by running the kctune command. If you change the value of nkthread, the kernel must be rebuilt for the new value to take effect. It is easier to change the value using SAM because there is an option to process the new kernel immediately.

See the kctune(1M) and sam(1M) manual pages.

Inaccessible system

The system you specified is not accessible. This could be for a variety of reasons such as, the system name was entered incorrectly or the system is not available over the network.

Checking communication with system01 ................. FAILED
  System not accessible : system01

Verifying systems: 12% ......................................
Estimated time remaining: 0:10 1 of 8
Checking system communication ......................... Done
System verification did not complete successfully
The following errors were discovered on the systems:
cannot resolve hostname host1
Enter the system names separated by spaces: q,? (host1)

Suggested solution: Verify that you entered the system name correctly; use the ping(1M) command to verify the accessibility of the host.

If a system cannot access the software source depot, either swagentd is not running on the target system or the swlist command cannot see the source depot.

Correct /etc/{hosts, nsswitch.conf} and continue from here
Continue? [Y/N] :

Suggested solutions: check that swagentd is running. Check whether there is an entry for the target system in /etc/hosts. If there is no entry, then ensure the hosts file is not the primary lookup for the "hosts" entry.
Storage Foundation Cluster File System problems

If there is a device failure or controller failure to a device, the file system may become disabled cluster-wide. To address the problem, unmount file system on all the nodes, then run a full `fsck`. When the file system check completes, mount all nodes again.

Unmount failures

The `umount` command can fail if a reference is being held by an NFS server. Unshare the mount point and try the unmount again.

Mount failures

Mounting a file system can fail for the following reasons:

- The file system is not using disk layout Version 6 or 7.
- The mount options do not match the options of already mounted nodes.
- A cluster file system is mounted by default with the `qio` option enabled if the node has a Quick I/O for Databases license installed, even if the `qio` mount option was not explicitly specified. If the Quick I/O license is not installed, a cluster file system is mounted without the `qio` option enabled. So if some nodes in the cluster have a Quick I/O license installed and others do not, a cluster mount can succeed on some nodes and fail on others due to different mount options. To avoid this situation, ensure that Quick I/O licensing is uniformly applied, or be careful to mount the cluster file system with the `qio/noqio` option appropriately specified on each node of the cluster. See the `mount(1M)` manual page.
- A shared CVM volume was not specified.
- The device is still mounted as a local file system somewhere on the cluster. Unmount the device.
- The `fsck` or `mkfs` command is being run on the same volume from another node, or the volume is mounted in non-cluster mode from another node.
- The `vxfsckd` daemon is not running. This typically happens only if the `CFSfsckd` agent was not started correctly.
- If `mount` fails with an error message:

```
vxfs mount: cannot open mnttab
```

`/etc/mnttab` is missing or you do not have root privileges.
If `mount` fails with an error message:

```
vxfs mount: device already mounted, ...
```

The device is in use by `mount`, `mkfs` or `fsck` on the same node. This error cannot be generated from another node in the cluster.

If this error message displays:

```
mount: slow
```

The node may be in the process of joining the cluster.

If you try to mount a file system that is already mounted without `-o cluster` option (that is, not in shared mode) on another cluster node,

```
# mount -F vxfs /dev/vx/dsk/share/vol01 /vol01
```

The following error message displays:

```
vxfs mount: /dev/vx/dsk/share/vol01 is already mounted,
/vol01 is busy, allowable number of mount points exceeded,
or cluster reservation failed for the volume
```

## Command failures

This section describes command failures.

- Manual pages not accessible with the `man` command. Set the `MANPATH` environment variable appropriately.
  
  See “Setting environment variables” on page 32.

- The `mount`, `fsck`, and `mkfs` utilities reserve a shared volume. They fail on volumes that are in use. Be careful when accessing shared volumes with other utilities such as `dd`, it is possible for these commands to destroy data on the disk.

- Running some commands, such as `vxupgrade -n 7 /vol02`, can generate the following error message:

  ````
vxfs vxupgrade: ERROR: not primary in a cluster file system
````

This means that you can run this command only on the primary, that is, the system that mounted this file system first.
Performance issues

Quick I/O File system performance is adversely affected if a cluster file system is mounted with the `qio` option enabled, but the file system is not used for Quick I/O files. Because `qio` is enabled by default, if you do not intend to use a shared file system for Quick I/O, explicitly specify the `noqio` option when mounting.

High availability issues

This section describes high availability issues.

Network partition and jeopardy

Network partition (or split brain) is a condition where a network failure can be misinterpreted as a failure of one or more nodes in a cluster. If one system in the cluster incorrectly assumes that another system failed, it may restart applications already running on the other system, thereby corrupting data. CFS tries to prevent this by having redundant heartbeat links.

At least one link must be active to maintain the integrity of the cluster. If all the links go down, after the last network link is broken, the node can no longer communicate with other nodes in the cluster. Thus the cluster is in one of two possible states. Either the last network link is broken (called a network partition condition), or the last network link is okay, but the node crashed, in which case it is not a network partition problem. It is not possible to identify whether it is the first or second state, so a kernel message is issued to indicate that a network partition may exist and there is a possibility of data corruption.

Jeopardy is a condition where a node in the cluster has a problem connecting to other nodes. In this situation, the link or disk heartbeat may be down, so a jeopardy warning may be displayed. Specifically, this message appears when a node has only one remaining link to the cluster and that link is a network link. This is considered a critical event because the node may lose its only remaining connection to the network.

Warning: Do not remove the communication links while shared storage is still connected.

Low memory

Under heavy loads, software that manages heartbeat communication links may not be able to allocate kernel memory. If this occurs, a node halts to avoid any chance of network partitioning. Reduce the load on the node if this happens frequently.
A similar situation may occur if the values in the /etc/llttab files on all cluster nodes are not correct or identical.

Upgrading Veritas Storage Foundation for Databases (SFDB) tools from 5.0MP2 to 5.1SP1 (2003131)

While upgrading from 50mp2 to 51SP1 the following error message could be seen when running sfua_rept_migrate:

```bash
# /opt/VRTSdbed/migrate/sfua_rept_migrate
Mounting SFUA Sybase ASA repository.
SFORA sfua_rept_migrate ERROR V-81-8903 Could not start repository database.
/usr/lib/dld.sl: Can't find path for shared library: libcur_colr.1
/usr/lib/dld.sl: No such file or directory
sh: 3845 Abort(coredump)
Symantec DBMS 3.0.85.0 vxdbms_start_db utility
ASA failed. Sybase ASA error code: [134].
Sybase ASA Error text: {{}}

SFORA sfua_rept_migrate ERROR V-81-9160 Failed to mount repository.
```
Troubleshooting cluster installation

This appendix includes the following topics:

- Installer cannot create UUID for the cluster
- The vxfentshdw utility fails when SCSI TEST UNIT READY command fails
- Troubleshooting server-based I/O fencing
- Troubleshooting server-based fencing on the SFCFS cluster nodes
- Troubleshooting server-based I/O fencing in mixed mode

Installer cannot create UUID for the cluster

The installer displays the following error message if the installer cannot find the uuidconfig.pl script before it configures the UUID for the cluster:

*Could't find uuidconfig.pl for uuid configuration, please create uuid manually before start vcs*

You may see the error message during SFCFS configuration, upgrade, or when you add a node to the cluster using the installer.

Workaround: To start SFCFS, you must run the uuidconfig.pl script manually to configure the UUID on each cluster node.

See the *Veritas Cluster Server Administrator’s Guide*. 
The vxfentsthwd utility fails when SCSI TEST UNIT READY command fails

While running the vxfentsthwd utility, you may see a message that resembles as follows:

Issuing SCSI TEST UNIT READY to disk reserved by other node FAILED.
Contact the storage provider to have the hardware configuration fixed.

The disk array does not support returning success for a SCSI TEST UNIT READY command when another host has the disk reserved using SCSI-3 persistent reservations. This happens with the Hitachi Data Systems 99XX arrays if bit 186 of the system mode option is not enabled.

Troubleshooting server-based I/O fencing

All CP server operations and messages are logged in the /var/VRTScps/log directory in a detailed and easy to read format. The entries are sorted by date and time. The logs can be used for troubleshooting purposes or to review for any possible security issue on the system that hosts the CP server.

The following files contain logs and text files that may be useful in understanding and troubleshooting a CP server:

■ /var/VRTScps/log/cpserver_[ABC].log
■ /var/VRTSat/vrtsat_broker.txt (Security related)
■ If the vxcpserv process fails on the CP server, then review the following diagnostic files:
  ■ /var/VRTScps.diag/FFDC_CPS_pid_vxcpserv.log
  ■ /var/VRTScps.diag/stack_pid_vxcpserv.txt

Note: If the vxcpserv process fails on the CP server, these files are present in addition to a core file. VCS restarts vxcpserv process automatically in such situations.

The file /var/VRTSvcs/log/vxfen/vxfend_[ABC].log contains logs and text files that may be useful in understanding and troubleshooting fencing-related issues on a SFCFS cluster (client cluster) node.
Troubleshooting issues related to the CP server service group

If you cannot bring up the CPSSG service group after the CP server configuration, perform the following steps:

- Verify that the CPSSG service group and its resources are valid and properly configured in the VCS configuration.
- Check the VCS engine log (/varVRTSvcs/log/engine_[ABC].log) to see if any of the CPSSG service group resources are FAULTED.
- Review the sample dependency graphs to make sure the required resources are configured correctly.

Checking the connectivity of CP server

You can test the connectivity of CP server using the `cpsadm` command.

You must have set the environment variables CPS_USERNAME and CPS_DOMAINTYPE to run the `cpsadm` command on the SFCFS cluster (client cluster) nodes.

**To check the connectivity of CP server**

- Run the following command to check whether a CP server is up and running at a process level:

  ```bash
  # cpsadm -s cp_server -a ping_cps
  
  ```

  where `cp_server` is the virtual IP address or virtual hostname on which the CP server is listening.
Troubleshooting server-based fencing on the SFCFS cluster nodes

The file `/varVRTSvcs/log/vxfen/vxfend_[ABC].log` contains logs and text files that may be useful in understanding and troubleshooting fencing-related issues on a SFCFS cluster (client cluster) node.

Issues during fencing startup on SFCFS cluster nodes set up for server-based fencing

| Table H-1 Fencing startup issues on SFCFS cluster (client cluster) nodes |
|---|---|
| **Issue** | **Description and resolution** |
| cpsadm command on the SFCFS cluster gives connection error | If you receive a connection error message after issuing the `cpsadm` command on the SFCFS cluster, perform the following actions:  
  ■ Ensure that the CP server is reachable from all the SFCFS cluster nodes.  
  ■ Check that the SFCFS cluster nodes use the correct CP server virtual IP or virtual hostname and the correct port number.  
  Check the `/etc/vxfenmode` file.  
  ■ Ensure that the running CP server is using the same virtual IP/virtual hostname and port number. |
| Authorization failure | Authorization failure occurs when the CP server's nodes or users are not added in the CP server configuration. Therefore, fencing on the SFCFS cluster (client cluster) node is not allowed to access the CP server and register itself on the CP server. Fencing fails to come up if it fails to register with a majority of the coordination points.  
To resolve this issue, add the CP server node and user in the CP server configuration and restart fencing.  
See “Preparing the CP servers manually for use by the SFCFS cluster” on page 169. |
Table H-1  Fencing startup issues on SFCFS cluster (client cluster) nodes (continued)

<table>
<thead>
<tr>
<th>Issue</th>
<th>Description and resolution</th>
</tr>
</thead>
<tbody>
<tr>
<td>Authentication failure</td>
<td>If you had configured secure communication between the CP server and the SFCFS cluster (client cluster) nodes, authentication failure can occur due to the following causes:</td>
</tr>
<tr>
<td></td>
<td>■ Symantec Product Authentication Services (AT) is not properly configured on the CP server and/or the SFCFS cluster.</td>
</tr>
<tr>
<td></td>
<td>■ The CP server and the SFCFS cluster nodes use the same root broker but the certificate hash of the root broker is not same on the SFCFS cluster and the CP server. Run the following command on both the CP server and the SFCFS cluster to see the certificate hash:</td>
</tr>
<tr>
<td></td>
<td># cpsat showalltrustedcreds</td>
</tr>
<tr>
<td></td>
<td>■ The CP server and the SFCFS cluster nodes use different root brokers, and trust is not established between the authentication brokers:</td>
</tr>
<tr>
<td></td>
<td>■ The hostname of the SFCFS cluster nodes is not the same hostname used when configuring AT.</td>
</tr>
<tr>
<td></td>
<td>The hostname of the SFCFS cluster nodes must be set to the hostname used when configuring AT. You can view the fully qualified hostname registered with AT using the cpsat showcred command. After entering this command, the hostname appears in the User Name field.</td>

</tr>
<tr>
<td></td>
<td>In order to configure secure communication, both the CP server and the SFCFS cluster must have same security setting.</td>
</tr>
<tr>
<td></td>
<td>In order to have the same security setting, the security parameter must have same value in the /etc/vxcps.conf file on CP server and in the /etc/vxfenmode file on the SFCFS cluster (client cluster) nodes.</td>
</tr>
</tbody>
</table>
Preexisting split-brain

Assume the following situations to understand preexisting split-brain in server-based fencing:

- There are three CP servers acting as coordination points. One of the three CP servers then becomes inaccessible. While in this state, also one client node leaves the cluster. When the inaccessible CP server restarts, it has a stale registration from the node which left the SFCFS cluster. In this case, no new nodes can join the cluster. Each node that attempts to join the cluster gets a list of registrations from the CP server. One CP server includes an extra registration (of the node which left earlier). This makes the joiner node conclude that there exists a preexisting split-brain between the joiner node and the node which is represented by the stale registration.

- All the client nodes have crashed simultaneously, due to which fencing keys are not cleared from the CP servers. Consequently, when the nodes restart, the vxfen configuration fails reporting preexisting split brain.

These situations are similar to that of preexisting split-brain with coordinator disks, where the problem is solved by the administrator running the `vxfenclearpre` command. A similar solution is required in server-based fencing using the `cpsadm` command.

Run the `cpsadm` command to clear a registration on a CP server:

```bash
# cpsadm -s cp_server -a unreg_node -c cluster_name -n nodeid
```

where `cp_server` is the virtual IP address or virtual hostname on which the CP server is listening, `cluster_name` is the VCS name for the SFCFS cluster, and `nodeid` specifies the node id of SFCFS cluster node. Ensure that fencing is not already running on a node before clearing its registration on the CP server.

After removing all stale registrations, the joiner node will be able to join the cluster.

### Issues during online migration of coordination points

During online migration of coordination points using the `vxfenswap` utility, the operation is automatically rolled back if a failure is encountered during validation of coordination points from all the cluster nodes.

Validation failure of the new set of coordination points can occur in the following circumstances:

- The `/etc/vxfenmode` file is not updated on all the SFCFS cluster nodes, because new coordination points on the node were being picked up from an old `/etc/vxfenmode` file.
- The coordination points listed in the `/etc/vxfenmode` file on the different SFCFS cluster nodes are not the same. If different coordination points are listed in the `/etc/vxfenmode` file on the cluster nodes, then the operation fails due to failure during the coordination point snapshot check.

- There is no network connectivity from one or more SFCFS cluster nodes to the CP server(s).

- Cluster, nodes, or users for the SFCFS cluster nodes have not been added on the new CP servers, thereby causing authorization failure.

**Vxfen service group activity after issuing the vxfenswap command**

After issuing the `vxfenswap` command, the Coordination Point agent reads the details of coordination points from the `vxfenconfig -l` output and starts monitoring the registrations on them.

During `vxfenswap`, when the `vxfenmode` file is being changed by the user, the Coordination Point agent does not move to FAULTED state but continues monitoring the old set of coordination points.

As long as the changes to `vxfenmode` file are not committed or the new set of coordination points are not re-elected in `vxfenconfig -l` output, the Coordination Point agent continues monitoring the old set of coordination points it read from `vxfenconfig -l` output in every monitor cycle.

The status of the Coordination Point agent (either ONLINE or FAULTED) depends upon the accessibility of the coordination points, the registrations on these coordination points, and the fault tolerance value.

When the changes to `vxfenmode` file are committed and reflected in the `vxfenconfig -l` output, then the Coordination Point agent reads the new set of coordination points and proceeds to monitor them in its new monitor cycle.

**Troubleshooting server-based I/O fencing in mixed mode**

Use the following procedure to troubleshoot a mixed I/O fencing configuration (configuration which uses both coordinator disks and CP server for I/O fencing).

This procedure uses the following commands to obtain I/O fencing information:

- To obtain I/O fencing cluster information on the coordinator disks, run the following command on one of the cluster nodes:

  ```bash
  # vxfenadm -s diskname
  ```
Any keys other than the valid keys used by the cluster nodes that appear in the command output are spurious keys.

To obtain I/O fencing cluster information on the CP server, run the following command on one of the cluster nodes:

```
# cpsadm -s cp_server -a list_membership -c cluster_name
```

where `cp_server` is the virtual IP address or virtual hostname on which the CP server is listening, and `cluster_name` is the VCS name for the SFCFS cluster. Nodes which are not in GAB membership, but registered with CP server indicate a pre-existing network partition.

Note that when running this command on the SFCFS cluster nodes, you need to first export the CPS_USERNAME and CPS_DOMAINTYPE variables. The CPS_USERNAME value is the user name which is added for this node on the CP server.

To obtain the user name, run the following command on the CP server:

```
# cpsadm -s cp_server -a list_users
```

where `cp_server` is the virtual IP address or virtual hostname on which the CP server is listening.

The CPS_DOMAINTYPE value is vx.

The following are export variable command examples:

```
# export CPS_USERNAME=_HA_VCS_test-system@HA_SERVICES@test-system.symantec.com

# export CPS_DOMAINTYPE=vx
```

Once a pre-existing network partition is detected using the above commands, all spurious keys on the coordinator disks or CP server must be removed by the administrator.
To troubleshoot server-based I/O fencing configuration in mixed mode

1. Review the current I/O fencing configuration by accessing and viewing the information in the vxfenmode file.

   Enter the following command on one of the SFCFS cluster nodes:

   ```
   # cat /etc/vxfenmode
   vxfen_mode=customized
   vxfen_mechanism=cps
   scsi3_disk_policy=dmp
   security=0
   cps1=[10.140.94.101]:14250
   vxfendg=vxfencoorddg
   ```

2. Review the I/O fencing cluster information.

   Enter the `vxfenadm -d` command on one of the cluster nodes:

   ```
   # vxfenadm -d
   I/O Fencing Cluster Information:
   =================================================

   Fencing Protocol Version: 201
   Fencing Mode: Customized
   Fencing Mechanism: cps
   Cluster Members:

   * 0 (galaxy)
   1 (nebula)

   RFSM State Information:
   node 0 in state 8 (running)
   node 1 in state 8 (running)
   ```
3 Review the SCSI registration keys for the coordinator disks used in the I/O fencing configuration.

The variables `disk_7` and `disk_8` in the following commands represent the disk names in your setup.

Enter the `vxfenadm -s` command on each of the SFCFS cluster nodes.

```
# vxfenadm -s /dev/vx/rdmp/disk_7
```

Device Name: /dev/vx/rdmp/disk_7
Total Number Of Keys: 2
key[0]:
  [Numeric Format]: 86,70,66,69,65,68,48,48
  [Character Format]: VFBEAD00
  [Node Format]: Cluster ID: 57069 Node ID: 0 Node Name: galaxy
key[1]:
  [Numeric Format]: 86,70,66,69,65,68,48,49
  [Character Format]: VFBEAD01
  [Node Format]: Cluster ID: 57069 Node ID: 1 Node Name: nebula

Run the command on the other node:

```
# vxfenadm -s /dev/vx/rdmp/disk_8
```

Device Name: /dev/vx/rdmp/disk_8
Total Number Of Keys: 2
key[0]:
  [Numeric Format]: 86,70,66,69,65,68,48,48
  [Character Format]: VFBEAD00
  [Node Format]: Cluster ID: 57069 Node ID: 0 Node Name: galaxy
key[1]:
  [Numeric Format]: 86,70,66,69,65,68,48,49
  [Character Format]: VFBEAD01
  [Node Format]: Cluster ID: 57069 Node ID: 1 Node Name: nebula
4 Review the CP server information about the cluster nodes. On the CP server, run the `cpsadm list nodes` command to review a list of nodes in the cluster.

```bash
# cpsadm -s cp_server -a list_nodes
```

where `cp_server` is the virtual IP address or virtual hostname on which the CP server is listening.

5 Review the CP server list membership. On the CP server, run the following command to review the list membership.

```bash
# cpsadm -s cp_server -a list_membership -c cluster_name
```

where `cp_server` is the virtual IP address or virtual hostname on which the CP server is listening, and `cluster_name` is the VCS name for the SFCFS cluster.

For example:

```bash
# cpsadm -s 10.140.94.101 -a list_membership -c gl-ss2
```

List of registered nodes: 0 1

---

**Checking keys on coordination points when vxfen_mechanism value is set to cps**

When I/O fencing is configured in customized mode and the `vxfen_mechanism` value is set to cps, the recommended way of reading keys from the coordination points (coordinator disks and CP servers) is as follows:

- For coordinator disks, the disks can be put in a file and then information about them supplied to the `vxfenadm` command.
  
  For example:

  ```bash
  # vxfenadm -s all -f file_name
  ```

- For CP servers, the `cpsadm` command can be used to obtain the membership of the SFCFS cluster.
  
  For example:

  ```bash
  # cpsadm -s cp_server -a list_membership -c cluster_name
  ```

where `cp_server` is the virtual IP address or virtual hostname on which CP server is configured, and `cluster_name` is the VCS name for the SFCFS cluster.
Troubleshooting cluster installation

Troubleshooting server-based I/O fencing in mixed mode
This appendix includes the following topics:

- Configuration diagrams for setting up server-based I/O fencing

### Configuration diagrams for setting up server-based I/O fencing

The following CP server configuration diagrams can be used as guides when setting up CP server within your configuration:

- Two unique client clusters that are served by 3 CP servers:
  See Figure I-1 on page 466.
- Client cluster that is served by highly available CP server and 2 SCSI-3 disks:
- Two node campus cluster that is served by remote CP server and 2 SCSI-3 disks:
- Multiple client clusters that are served by highly available CP server and 2 SCSI-3 disks:

### Two unique client clusters served by 3 CP servers

*Figure I-1* displays a configuration where two unique client clusters are being served by 3 CP servers (coordination points). Each client cluster has its own unique user ID (UUID1 and UUID2).
In the `vxfenmode` file on the client nodes, `vxfenmode` is set to `customized` with `vxfen mechanism` set to `cps`.

Figure I-1  Two unique client clusters served by 3 CP servers

Client cluster served by highly available CPS and 2 SCSI-3 disks

Figure I-2 displays a configuration where a client cluster is served by one highly available CP server and 2 local SCSI-3 LUNs (disks).
In the `vxfenmode` file on the client nodes, `vxfenmode` is set to customized with `vxfen mechanism set to cps`.

The two SCSI-3 disks are part of the disk group vxfencoorddg. The third coordination point is a CP server hosted on an SFHA cluster, with its own shared database and coordinator disks.

**Figure I-2**  Client cluster served by highly available CP server and 2 SCSI-3 disks
Two node campus cluster served by remote CP server and 2 SCSI-3 disks

Figure I-3 displays a configuration where a two node campus cluster is being served by one remote CP server and 2 local SCSI-3 LUN (disks).

In the `vxfenmode` file on the client nodes, `vxfenmode` is set to customized with `vxfen mechanism` set to `cps`.

The two SCSI-3 disks (one from each site) are part of disk group `vxfencoorddg`. The third coordination point is a CP server on a single node VCS cluster.
The coordinator disk group specified in /etc/vxfenmode should have one SCSI3 disk from site 1 and another from site 2.

**Legends**
- Private Interconnects (GigE)
- Public Links (GigE)
- Dark Fiber
- Connections
- San 1 Connections
- San 2 Connections
Multiple client clusters served by highly available CP server and 2 SCSI-3 disks

Figure I-4 displays a configuration where multiple client clusters are being served by one highly available CP server and 2 local SCSI-3 LUNS (disks).

In the `vxfenmode` file on the client nodes, `vxfenmode` is set to customized with `vxfen mechanism set to cps`.

The two SCSI-3 disks are part of the disk group `vxfencoorddg`. The third coordination point is a CP server, hosted on an SFHA cluster, with its own shared database and coordinator disks.
Multiple client clusters served by highly available CP server and 2 SCSI-3 disks

The coordinator disk group specified in `/etc/vxfenmode` should have these 2 disks.
Sample SFCFS cluster setup diagrams for CP server-based I/O fencing
Configuration diagrams for setting up server-based I/O fencing
Reconciling major/minor numbers for NFS shared disks

This appendix includes the following topics:

- Reconciling major/minor numbers for NFS shared disks

Reconciling major/minor numbers for NFS shared disks

Your configuration may include disks on the shared bus that support NFS. You can configure the NFS file systems that you export on disk partitions or on Veritas Volume Manager volumes. An example disk partition name is /dev/dsk/c1t1d0. An example volume name is /dev/vx/dsk/shareddg/vol3. Each name represents the block device on which the file system is to be mounted.

In a VCS cluster, block devices providing NFS service must have the same major and minor numbers on each cluster node. Major numbers identify required device drivers (such as a HP-UX 11i v3 partition or a VxVM volume). Minor numbers identify the specific devices themselves. NFS also uses major and minor numbers to identify the exported file system.

Major and minor numbers must be verified to ensure that the NFS identity for the file system is the same when exported from each node.
Checking major and minor numbers for disk partitions

The following sections describe checking and changing, if necessary, the major and minor numbers for disk partitions used by cluster nodes.

To check major and minor numbers on disk partitions

- Use the following command on all nodes exporting an NFS file system. This command displays the major and minor numbers for the block device.

  # ls -lL block_device

  The variable block_device refers to a partition where a file system is mounted for export by NFS. Use this command on each NFS file system. For example, type:

  # ls -lL /dev/dsk/c1t1d0

  Output on Node A resembles:
  
  crw-r----- 1 root sys 32,1 Dec 3 11:50 /dev/dsk/c1t1d0

  Output on Node B resembles:

  crw-r----- 1 root sys 32,1 Dec 3 11:55 /dev/dsk/c1t1d0

  Note that the major numbers (32) and the minor numbers (1) match, satisfactorily meeting the requirement for NFS file systems.

To reconcile the major numbers that do not match on disk partitions

1. Reconcile the major and minor numbers, if required. For example, if the output in the previous section resembles the following, perform the instructions beginning step 2:

   Output on Node A:

   crw-r----- 1 root sys 32,1 Dec 3 11:50 /dev/dsk/c1t1d0

   Output on Node B:

   crw-r----- 1 root sys 36,1 Dec 3 11:55 /dev/dsk/c1t1d0

2. Place the VCS command directory in your path. For example:

   # export PATH=$PATH:/usr/sbin:/sbin:/opt/VRTS/bin
3. Attempt to change the major number on System B (now 36) to match that of System A (32). Use the command:

```
# haremajor -sd major_number
```

For example, on Node B, enter:

```
# haremajor -sd 32
```

4. If the command succeeds, go to step 8.

5. If the command fails, you may see a message resembling:

```
Error: Preexisting major number 32
These are available numbers on this system: 128...
Check /etc/name_to_major on all systems for available numbers.
```

6. Notice that the number 36 (the major number on Node A) is not available on Node B. Run the `haremajor` command on Node B and change it to 128.

```
# haremajor -sd 128
```

7. Run the same command on Node A. If the command fails on Node A, the output lists the available numbers. Rerun the command on both nodes, setting the major number to one available to both.

8. Reboot each system on which the command succeeds.

9. Proceed to reconcile the major numbers for your next partition.

**To reconcile the minor numbers that do not match on disk partitions**

1. In the example, the minor numbers are 1 and 3 and are reconciled by setting to 30 on each node.

2. Type the following command on both nodes using the name of the block device:

```
# ls -l /dev/dsk/c1t1d0
```

Output from this command resembles the following on Node A:

```
lrwxrwxrwx 1 root root 83 Dec 3 11:50 /dev/dsk/c1t1d0 -> ../../devices/sbus@1f,0/QLGC,isp@0,10000/sd@1,0:d,raw
```

The device name (in bold) includes the slash following the word `devices`, and continues to, but does not include, the colon.
3 Type the following command on both nodes to determine the instance numbers that the SCSI driver uses:

```bash
# grep sd /etc/path_to_inst | sort -n -k 2,2
```

Output from this command resembles the following on Node A:

```
"/sbus@1f,0/QLGC,isp@0,10000/sd@0,0" 0 "sd"
"/sbus@1f,0/QLGC,isp@0,10000/sd@1,0" 1 "sd"
"/sbus@1f,0/QLGC,isp@0,10000/sd@2,0" 2 "sd"
"/sbus@1f,0/QLGC,isp@0,10000/sd@3,0" 3 "sd"
```

In the output, the instance numbers are in the second field.

The instance number that is associated with the device name that matches the name for Node A displayed in step 2, is "1."

4 Compare instance numbers for the device in the output on each node.

After you review the instance numbers, perform one of the following tasks:

- If the instance number from one node is unused on the other— it does not appear in the output of step 3—edit `/etc/path_to_inst`.
  
  You edit this file to make the second node’s instance number similar to the number of the first node.

- If the instance numbers in use on both nodes, edit `/etc/path_to_inst` on both nodes. Change the instance number that is associated with the device name to an unused number. The number needs to be greater than the highest number that other devices use. For example, the output of step 3 shows the instance numbers that all devices use (from 0 to 29). You edit the file `/etc/path_to_inst` on each node and reset the instance numbers to 30.

5 Type the following command to reboot each node on which `/etc/path_to_inst` was modified:

```bash
# reboot -- -rv
```
Checking the major and minor number for VxVM volumes

The following sections describe checking and changing, if necessary, the major and minor numbers for the VxVM volumes that cluster systems use.

To check major and minor numbers on VxVM volumes

1. Place the VCS command directory in your path. For example:

   ```
   # export PATH=$PATH:/usr/sbin:/sbin:/opt/VRTS/bin
   ```

2. To list the devices, use the `ls -lL block_device` command on each node:

   ```
   # ls -lL /dev/vx/dsk/shareddg/vol3
   ```

   On Node A, the output may resemble:

   ```
   brw------- 1 root  root 32,43000 Mar 22 16:4 1
   /dev/vx/dsk/shareddg/vol3
   ```

   On Node B, the output may resemble:

   ```
   brw------- 1 root  root 36,43000 Mar 22 16:4 1
   /dev/vx/dsk/shareddg/vol3
   ```

3. Import the associated shared disk group on each node.
4 Use the following command on each node exporting an NFS file system. The command displays the major numbers for `vxio` and `vxspec` that Veritas Volume Manager uses. Note that other major numbers are also displayed, but only `vxio` and `vxspec` are of concern for reconciliation:

```
# grep vx /etc/name_to_major
```

Output on Node A:

```
vxdmp 30
vxio 32
vxspec 33
vxfen 87
vxglm 91
```

Output on Node B:

```
vxdmp 30
vxio 36
vxspec 37
vxfen 87
vxglm 91
```

5 To change Node B’s major numbers for `vxio` and `vxspec` to match those of Node A, use the command:

```
haremajor -vx major_number_vxio major_number_vxspec
```

For example, enter:

```
# haremajor -vx 32 33
```

If the command succeeds, proceed to step 8. If this command fails, you receive a report similar to the following:

```
Error: Preexisting major number 32
These are available numbers on this system: 128...
Check /etc/name_to_major on all systems for available numbers.
```
6 If you receive this report, use the `haremajor` command on Node A to change the major number (32/33) to match that of Node B (36/37). For example, enter:

```
# haremajor -vx 36 37
```

If the command fails again, you receive a report similar to the following:

```
Error: Preexisting major number 36
These are available numbers on this node: 126...
Check /etc/name_to_major on all systems for available numbers.
```

7 If you receive the second report, choose the larger of the two available numbers (in this example, 128). Use this number in the `haremajor` command to reconcile the major numbers. Type the following command on both nodes:

```
# haremajor -vx 128 129
```

8 Reboot each node on which `haremajor` was successful.

9 If the minor numbers match, proceed to reconcile the major and minor numbers of your next NFS block device.

10 If the block device on which the minor number does not match is a volume, consult the `vxdg(1M)` manual page. The manual page provides instructions on reconciling the Veritas Volume Manager minor numbers, and gives specific reference to the `reminor` option.

Node where the vxio driver number have been changed require rebooting.
Reconciling major/minor numbers for NFS shared disks
Configuring LLT over UDP using IPv6

This appendix includes the following topics:

- Using the UDP layer of IPv6 for LLT
- Manually configuring LLT over UDP using IPv6

Using the UDP layer of IPv6 for LLT

Veritas Storage Foundation Cluster File System 5.1 SP1 provides the option of using LLT over the UDP (User Datagram Protocol) layer for clusters using wide-area networks and routers. UDP makes LLT packets routable and thus able to span longer distances more economically.

When to use LLT over UDP

Use LLT over UDP in the following situations:

- LLT must be used over WANs
- When hardware, such as blade servers, do not support LLT over Ethernet

Manually configuring LLT over UDP using IPv6

The following checklist is to configure LLT over UDP:

- For UDP6, the multicast address is set to ".-".
- Make sure that each NIC has an IPv6 address that is configured before configuring LLT.
- Make sure the IPv6 addresses in the /etc/llttab files are consistent with the IPv6 addresses of the network interfaces.
- Make sure that each link has a unique not well-known UDP port. See “Selecting UDP ports” on page 483.
- For the links that cross an IP router, disable multicast features and specify the IPv6 address of each link manually in the /etc/llttab file. See “Sample configuration: links crossing IP routers” on page 485.

The link command in the /etc/llttab file

Review the link command information in this section for the /etc/llttab file. See the following information for sample configurations:
- See “Sample configuration: direct-attached links” on page 484.
- See “Sample configuration: links crossing IP routers” on page 485.

Note that some of the fields in Table K-1 differ from the command for standard LLT links.

Table K-1 describes the fields of the link command that are shown in the /etc/llttab file examples.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag-name</td>
<td>A unique string that is used as a tag by LLT; for example link1, link2,...</td>
</tr>
<tr>
<td>device</td>
<td>The device path of the UDP protocol; for example /dev/udp6.</td>
</tr>
<tr>
<td>node-range</td>
<td>Nodes using the link. &quot;-&quot; indicates all cluster nodes are to be configured for this link.</td>
</tr>
<tr>
<td>link-type</td>
<td>Type of link; must be &quot;udp6&quot; for LLT over UDP.</td>
</tr>
<tr>
<td>udp-port</td>
<td>Unique UDP port in the range of 49152-65535 for the link.</td>
</tr>
<tr>
<td></td>
<td>See “Selecting UDP ports” on page 483.</td>
</tr>
<tr>
<td>MTU</td>
<td>&quot;.&quot; is the default, which has a value of 8192. The value may be increased or decreased depending on the configuration. Use the lltstat -l command to display the current value.</td>
</tr>
<tr>
<td>IPv6 address</td>
<td>IPv6 address of the link on the local node.</td>
</tr>
<tr>
<td>mcast-address</td>
<td>&quot;.&quot; is the default for clusters spanning routers.</td>
</tr>
</tbody>
</table>
The set-addr command in the /etc/llttab file

The `set-addr` command in the /etc/llttab file is required when the multicast feature of LLT is disabled, such as when LLT must cross IP routers.

See “Sample configuration: links crossing IP routers” on page 485.

Table K-2 describes the fields of the set-addr command.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-id</td>
<td>The ID of the cluster node; for example, 0.</td>
</tr>
<tr>
<td>link tag-name</td>
<td>The string that LLT uses to identify the link; for example link1, link2,....</td>
</tr>
<tr>
<td>address</td>
<td>IPv6 address assigned to the link for the peer node.</td>
</tr>
</tbody>
</table>

Selecting UDP ports

When you select a UDP port, select an available 16-bit integer from the range that follows:

- Use available ports in the private range 49152 to 65535
- Do not use the following ports:
  - Ports from the range of well-known ports, 0 to 1023
  - Ports from the range of registered ports, 1024 to 49151

To check which ports are defined as defaults for a node, examine the file /etc/services. You should also use the `netstat` command to list the UDP ports currently in use. For example:

```
# netstat -a | head -2 ; netstat -a | grep udp
```

Active Internet connections (including servers)

<table>
<thead>
<tr>
<th>Proto</th>
<th>Recv-Q</th>
<th>Send-Q</th>
<th>Local Address</th>
<th>Foreign Address</th>
<th>(state)</th>
</tr>
</thead>
<tbody>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.ntalk</td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td><em>.</em></td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.49193</td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.49152</td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.portmap</td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td><em>.</em></td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.135</td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.2121</td>
<td><em>.</em></td>
<td></td>
</tr>
<tr>
<td>udp</td>
<td>0</td>
<td>0</td>
<td>*.xdmcp</td>
<td><em>.</em></td>
<td></td>
</tr>
</tbody>
</table>
Look in the UDP section of the output; the UDP ports that are listed under Local Address are already in use. If a port is listed in the /etc/services file, its associated name is displayed rather than the port number in the output.

Sample configuration: direct-attached links

Figure K-1 depicts a typical configuration of direct-attached links employing LLT over UDP.

![Figure K-1](image-url)
The configuration that the /etc/llttab file for Node 0 represents has directly attached crossover links. It might also have the links that are connected through a hub or switch. These links do not cross routers.

LLT uses IPv6 multicast requests for peer node address discovery. So the addresses of peer nodes do not need to be specified in the /etc/llttab file using the set-addr command. Use the ifconfig interface_name command to verify that the IPv6 address is set correctly.

You can also use the lanscan command to verify the IPv6 address.

```
set-node Node0
set-cluster 1
#configure Links
#link tag-name device node-range link-type udp port MTU \ 
   IP-address mcast-address
link link1 /dev/udp6 - udp6 50000 - fe80::21a:64ff:fe92:1b46 -
link link1 /dev/udp6 - udp6 50001 - fe80::21a:64ff:fe92:1b47 -
```

The file for Node 1 resembles:

```
set-node Node1
set-cluster 1
#configure Links
#link tag-name device node-range link-type udp port MTU \ 
   IP-address mcast-address
link link1 /dev/udp6 - udp6 50000 - fe80::21a:64ff:fe92:1a92 -
link link1 /dev/udp6 - udp6 50001 - fe80::21a:64ff:fe92:1a93 -
```

Sample configuration: links crossing IP routers

Figure K-2 depicts a typical configuration of links crossing an IP router employing LLT over UDP. The illustration shows two nodes of a four-node cluster.
The configuration that the following `/etc/llttab` file represents for Node 1 has links crossing IP routers. Notice that IPv6 addresses are shown for each link on each peer node. In this configuration multicasts are disabled.

```plaintext
set-node Node1
set-cluster 1

link link1 /dev/udp6 - udp6 50000 - fe80::21a:64ff:fe92:1a92 -
link link1 /dev/udp6 - udp6 50001 - fe80::21a:64ff:fe92:1a93 -
#set address of each link for all peer nodes in the cluster
#format: set-addr node-id link tag-name address
set-addr 0 link1 fe80::21a:64ff:fe92:1b46
set-addr 0 link2 fe80::21a:64ff:fe92:1b47
set-addr 2 link1 fe80::21a:64ff:fe92:1d70
set-addr 2 link2 fe80::21a:64ff:fe92:1d71
set-addr 3 link1 fe80::209:6bff:fe1b:1c94
set-addr 3 link2 fe80::209:6bff:fe1b:1c95

#disable LLT multicasts
set-bcasthb 0
set-arp 0
```

The `/etc/llttab` file on Node 0 resembles:

```plaintext
set-node Node0
set-cluster 1
```
link link1 /dev/udp6 - udp6 50000 - fe80::21a:64ff:fe92:1b46 -
link link2 /dev/udp6 - udp6 50001 - fe80::21a:64ff:fe92:1b47 -

#set address of each link for all peer nodes in the cluster
#format: set-addr node-id link tag-name address
set-addr 1 link1 fe80::21a:64ff:fe92:1a92
set-addr 1 link2 fe80::21a:64ff:fe92:1a93
set-addr 2 link1 fe80::21a:64ff:fe92:1d70
set-addr 2 link2 fe80::21a:64ff:fe92:1d71
set-addr 3 link1 fe80::209:6bff:fe1b:1c94
set-addr 3 link2 fe80::209:6bff:fe1b:1c95

#disable LLT multicasts
set-bcasthb 0
set-arp 0
Configuring LLT over UDP using IPv6

Manually configuring LLT over UDP using IPv6
Configuring LLT over UDP using IPv4

This appendix includes the following topics:

- Using the UDP layer for LLT
- Manually configuring LLT over UDP using IPv4

Using the UDP layer for LLT

Veritas Storage Foundation Cluster File System 5.1 SP1 provides the option of using LLT over the UDP (User Datagram Protocol) layer for clusters using wide-area networks and routers. UDP makes LLT packets routable and thus able to span longer distances more economically.

When to use LLT over UDP

Use LLT over UDP in the following situations:

- LLT must be used over WANs
- When hardware, such as blade servers, do not support LLT over Ethernet

LLT over UDP is slower than LLT over Ethernet. Use LLT over UDP only when the hardware configuration makes it necessary.

Manually configuring LLT over UDP using IPv4

The following checklist is to configure LLT over UDP:

- Make sure that the LLT private links are on different physical networks.
If the LLT private links are not on different physical networks, then make sure that the links are on separate subnets. Set the broadcast address in `/etc/llttab` explicitly depending on the subnet for each link. See “Broadcast address in the `/etc/llttab` file” on page 490.

- Make sure that each NIC has an IP address that is configured before configuring LLT.
- Make sure the IP addresses in the `/etc/llttab` files are consistent with the IP addresses of the network interfaces.
- Make sure that each link has a unique not well-known UDP port. See “Selecting UDP ports” on page 492.
- Set the broadcast address correctly for direct-attached (non-routed) links. See “Sample configuration: direct-attached links” on page 494.
- For the links that cross an IP router, disable broadcast features and specify the IP address of each link manually in the `/etc/llttab` file. See “Sample configuration: links crossing IP routers” on page 496.

### Broadcast address in the `/etc/llttab` file

The broadcast address is set explicitly for each link in the following example.

- Display the content of the `/etc/llttab` file on the first node galaxy:

```
galaxy # cat /etc/llttab
set-node galaxy
set-cluster 1
link link1 /dev/udp - udp 50000 - 192.168.9.1 192.168.9.255
link link2 /dev/udp - udp 50001 - 192.168.10.1 192.168.10.255
```

Verify the subnet mask using the `ifconfig` command to ensure that the two links are on separate subnets.

```
galaxy # ifconfig lan1
lan1: flags=1843<UP,BROADCAST,RUNNING,MULTICAST,CKO>
       inet 192.168.9.1 netmask ffffff00 broadcast 192.168.9.255
```

```
galaxy # ifconfig lan2
lan2: flags=1843<UP,BROADCAST,RUNNING,MULTICAST,CKO>
       inet 192.168.10.1 netmask ffffff00 broadcast 192.168.10.255
```

- Display the content of the `/etc/llttab` file on the second node nebula:

```
nebula # cat /etc/llttab
set-node nebula
```

Manually configuring LLT over UDP using IPv4
set-cluster 1
link link1 /dev/udp - udp 50000 - 192.168.9.2 192.168.9.255
link link2 /dev/udp - udp 50001 - 192.168.10.2 192.168.10.255

Verify the subnet mask using the `ifconfig` command to ensure that the two links are on separate subnets.

```bash
ebula # ifconfig lan1
lan1: flags=1843<UP,BROADCAST,RUNNING,MULTICAST,CKO>
       inet 192.168.9.2 netmask fffffff00 broadcast 192.168.9.255
nebula # ifconfig lan2
lan2: flags=1843<UP,BROADCAST,RUNNING,MULTICAST,CKO>
       inet 192.168.10.2 netmask fffffff00 broadcast 192.168.10.255
```

The link command in the `/etc/llttab` file

Review the link command information in this section for the `/etc/llttab` file. See the following information for sample configurations:

- See “Sample configuration: direct-attached links” on page 494.
- See “Sample configuration: links crossing IP routers” on page 496.

**Table L-1** describes the fields of the link command that are shown in the `/etc/llttab` file examples. Note that some of the fields differ from the command for standard LLT links.

**Table L-1** Field description for link command in `/etc/llttab`

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tag-name</td>
<td>A unique string that is used as a tag by LLT; for example link1, link2,...</td>
</tr>
<tr>
<td>device</td>
<td>The device path of the UDP protocol; for example <code>/dev/udp</code>.</td>
</tr>
<tr>
<td>node-range</td>
<td>Nodes using the link. &quot;-&quot; indicates all cluster nodes are to be configured for this link.</td>

               ■ "-" is the default for clusters spanning routers. |

The set-addr command in the /etc/llttab file

The `set-addr` command in the `/etc/llttab` file is required when the broadcast feature of LLT is disabled, such as when LLT must cross IP routers.

See “Sample configuration: links crossing IP routers” on page 496. Table L-2 describes the fields of the set-addr command.

Table L-2

Field description for set-addr command in /etc/llttab

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>node-id</td>
<td>The ID of the cluster node; for example, 0.</td>
</tr>
<tr>
<td>link tag-name</td>
<td>The string that LLT uses to identify the link; for example link1, link2,....</td>
</tr>
<tr>
<td>address</td>
<td>IP address assigned to the link for the peer node.</td>
</tr>
</tbody>
</table>

Selecting UDP ports

When you select a UDP port, select an available 16-bit integer from the range that follows:

■ Use available ports in the private range 49152 to 65535

■ Do not use the following ports:

■ Ports from the range of well-known ports, 0 to 1023

■ Ports from the range of registered ports, 1024 to 49151

To check which ports are defined as defaults for a node, examine the file `/etc/services`. You should also use the `netstat` command to list the UDP ports currently in use. For example:

```
# netstat -a | head -2 ; netstat -a | grep udp
Active Internet connections (including servers)
```
Look in the UDP section of the output; the UDP ports that are listed under Local Address are already in use. If a port is listed in the /etc/services file, its associated name is displayed rather than the port number in the output.

### Configuring the netmask for LLT

For nodes on different subnets, set the netmask so that the nodes can access the subnets in use. Run the following command and answer the prompt to set the netmask:

```
# set_parms ip_address
```

For example:

- **For the first network interface on the node galaxy:**

  IP address=192.168.9.1, Broadcast address=192.168.9.255, Netmask=255.255.255.0

- **For the first network interface on the node nebula:**

  IP address=192.168.9.2, Broadcast address=192.168.9.255, Netmask=255.255.255.0
For the second network interface on the node galaxy:

IP address=192.168.10.1, Broadcast address=192.168.10.255,
Netmask=255.255.255.0

For the second network interface on the node nebula:

IP address=192.168.10.2, Broadcast address=192.168.10.255,
Netmask=255.255.255.0

Configuring the broadcast address for LLT

For nodes on different subnets, set the broadcast address in `/etc/llttab` depending on the subnet that the links are on.

An example of a typical `/etc/llttab` file when nodes are on different subnets. Note the explicitly set broadcast address for each link.

```bash
# cat /etc/llttab
set-node nodexyz
set-cluster 100

link link1 /dev/udp - udp 50000 - 192.168.30.1 192.168.30.255
link link2 /dev/udp - udp 50001 - 192.168.31.1 192.168.31.255
```

Sample configuration: direct-attached links

Figure L-1 depicts a typical configuration of direct-attached links employing LLT over UDP.
The configuration that the /etc/llttab file for Node 0 represents has directly attached crossover links. It might also have the links that are connected through a hub or switch. These links do not cross routers.

LLT broadcasts requests peer nodes to discover their addresses. So the addresses of peer nodes do not need to be specified in the /etc/llttab file using the set-addr command. For direct attached links, you do need to set the broadcast address of the links in the /etc/llttab file. Verify that the IP addresses and broadcast addresses are set correctly by using the ifconfig interface_name command.

```
set-node Node0
set-cluster 1
#configure Links
#link tag-name device node-range link-type udp port MTU \ 
  IP-address bcast-address
link link1 /dev/udp - udp 50000 - 192.1.2.1 192.1.2.255
link link2 /dev/udp - udp 50001 - 192.1.3.1 192.1.3.255
```

The file for Node 1 resembles:

```
set-node Node1
set-cluster 1
```
Sample configuration: links crossing IP routers

Figure L-2 depicts a typical configuration of links crossing an IP router employing LLT over UDP. The illustration shows two nodes of a four-node cluster.

The configuration that the following `/etc/llttab` file represents for Node 1 has links crossing IP routers. Notice that IP addresses are shown for each link on each peer node. In this configuration broadcasts are disabled. Hence, the broadcast address does not need to be set in the `link` command of the `/etc/llttab` file.

```
# configure Links
#link tag-name device node-range link-type udp port MTU \ IP-address bcast-address
link link1 /dev/udp - udp 50000 - 192.1.2.2 192.1.2.255
link link2 /dev/udp - udp 50001 - 192.1.3.2 192.1.3.255

set-node Node1
set-cluster 1

link link1 /dev/udp - udp 50000 - 192.1.3.1 -
link link2 /dev/udp - udp 50001 - 192.1.4.1 -
#set address of each link for all peer nodes in the cluster
#format: set-addr node-id link tag-name address
set-addr 0 link1 192.1.1.1
set-addr 0 link2 192.1.2.1
set-addr 2 link1 192.1.5.2
set-addr 2 link2 192.1.6.2
```
set-addr 3 link1 192.1.7.3
set-addr 3 link2 192.1.8.3

#disable LLT broadcasts
set-bcasthb 0
set-arp 0

The /etc/llttab file on Node 0 resembles:

set-node Node0
set-cluster 1

link link1 /dev/udp - udp 50000 - 192.1.1.1 -
link link2 /dev/udp - udp 50001 - 192.1.2.1 -

#set address of each link for all peer nodes in the cluster
#format: set-addr node-id link tag-name address
set-addr 1 link1 192.1.3.1
set-addr 1 link2 192.1.4.1
set-addr 2 link1 192.1.5.2
set-addr 2 link2 192.1.6.2
set-addr 3 link1 192.1.7.3
set-addr 3 link2 192.1.8.3

#disable LLT broadcasts
